The research activity will be aimed at identifying and testing control architectures and strategies for optimizing and integrating public lighting systems with storage and charging station for micro-mobility electric vehicles.

The control will be also aimed at reaching satisfactory performances in terms of power quality and wave form, acceptable voltage profiles and the respect of all capacity limits for energy transfer.

Technical solutions and prototypes developed during the project will be tested using “power hardware in the loop” approaches. These tests will be developed by the research fellow using a real time digital simulator OPAL RT OP5600 and a power amplifier Triphase PM15A30F30
