<b>Course title</b>	Advanced Transportation Accessibility-Equity Assessment
<b>Lecturer</b>	Simona De Bartolomeo
<b>Scientific Discipline Sector</b>	CEAR-03/B
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year/Semester</b>	First/First
<b>Tentative Calendar</b>	11/03/2026: 14.00-19:00 25/03/2026: 14.00-19:00 15/04/2026: 14.00- 19:00 29/04/2026: 14.00-19:00
<b>SUMMARY /GOAL</b>	The final scope is to equip students with advanced analytical tools and critical perspectives essential for addressing the interplay between transportation systems and social equity in diverse territorial contexts.
<b>Syllabus</b>	This course delves into the field of Transport Accessibility and Equity Assessment, providing an in-depth exploration of key concepts, methodologies and tools. The aims of the course are: Exploring the Principles of Accessibility-Based Transportation Planning (e.g., 15 minutes city); Utilizing Evaluation Tools and Performance Indicators for Measuring Progress Toward Transportation Equity Goals (e.g., threshold measures, gravity measures, PTAL, Lorenz Curve, Gini Index); Provide with transportation policy evaluation tools that account for the costs and benefits of equitable planning (e.g. through cost-benefit analysis and multicriteria evaluations).
<b>Bibliography</b>	Scientific papers, slides and support material from the lecturer
<b>Examination method</b>	Oral exam by slide presentation on the topics of the lectures (PP presentation)
<b>Room</b>	On-site Please send an email to <a href="mailto:simona.debartolomeo@poliba.it">simona.debartolomeo@poliba.it</a> to enroll in the course

## DCMCEI

<b>Course title</b>	Complex Network Theory: Theory, Methods and Applications
<b>Lecturer</b>	Antonietta Simone
<b>Scientific Discipline Sector</b>	CEAR-01/B
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The integration of both mathematical and technical tools, as well as the growing availability of data, make it possible to study and interpret an enormous number of complex systems, where the main component is topology, that is, the way in which elements are connected and interact with each other.</p> <p>This course offers an overview of all the Complex Network Theory tools and their use in the study and analysis of real systems from a topological perspective, starting from water systems, which represent complex networks composed of several interconnected components, structured in non-trivial configurations, whose behavior is largely influenced by their connective structure, spatial limits, and interactions between components. This course aims to address the following points:</p> <ul style="list-style-type: none"> <li>– Introduction to CNT. Euler and the problem of the Königsberg bridges. Graphical representation and adjacency matrix. Basic concepts and study of topological properties.</li> <li>– Centrality metrics as tools to identify the most important elements in complex real systems. Degree, Betweenness, Closeness and Harmonic.</li> <li>– Construction of predictive models for understanding complex real systems. How the connective structure is fundamental to determine vulnerability and robustness. Regular, random, small-world (principle of six degrees of separation) and scale-free networks.</li> <li>– Communities and clustering for system analysis and management. Detecting the presence of communities is essential for discovering the internal connections of</li> </ul>

	<p>complex structures and facilitating practical applications in many disciplines.</p> <ul style="list-style-type: none"><li>– Time series and their representation in CNT: Visibility algorithms.</li></ul> <p>Overview of the different fields of application: social systems, road networks, distribution systems, biological organisms, technological networks, computer networks, epidemiology, etc.</p>

<b>Course title</b>	Innovative and recyclable methods and materials for Civil Engineering applications
<b>Lecturer</b>	Vincenzo Fazio
<b>Scientific Discipline Sector</b>	MATH-04/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year/Semester</b>	First/First
<b>Tentative Calendar</b>	<p>27/01/2026: 15.00-17:30            29/01/2026: 15.00-17:30            03/02/2026: 15.00-17:30            05/02/2026: 15.00-17:30            10/02/2026: 15.00-17:30            12/02/2026: 15.00-17:30            17/02/2026: 15.00-17:30            19/02/2026: 15.00-17:30</p>
<b>SUMMARY /GOAL</b>	The course aims to provide PhD students with advanced knowledge and tools for the design, characterization, and modeling of innovative and recyclable materials for Civil Engineering applications. Emphasis will be placed on the multiscale nature of such materials and on the integration of physics-based and data-driven approaches to describe their thermo-hygro-mechanical behavior. Students will gain familiarity with the fundamental mechanisms governing damage and degradation processes, as well as with modern modeling strategies that combine continuum mechanics, bio-inspired design concepts, and machine learning techniques. The ultimate goal is to promote a multidisciplinary understanding of sustainable materials, enabling the development of new solutions for resilient and environmentally responsible civil engineering systems.
<b>Syllabus</b>	<ol style="list-style-type: none"> <li>1. Multiscale methods for the design and characterization of innovative and recyclable materials;</li> <li>2. Thermo-hygro-mechanical properties of innovative and bio-inspired materials for Civil Engineering;</li> <li>3. Damage effects induced by temperature, mechanical stress and chemical phenomena;</li> <li>4. Design and characterization of materials with complex structures based on data modelling approaches.</li> </ol>

<b>Course title</b>	IoT Technologies for Digital Transition
<b>Lecturer</b>	Adnan Rashid
<b>Scientific Discipline Sector</b>	IINF-03/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year/Semester</b>	First/First
<b>Tentative Calendar</b>	12/01/2026: 09.00-12:00 15/01/2026: 09.00-12:00 19/01/2026: 09.00-12:00 22/01/2026: 09.00-12:00 26/01/2026: 09.00-12:00 29/01/2026: 09.00-12:00 02/02/2026: 09.00-11:00
<b>SUMMARY /GOAL</b>	The course aims to equip Ph.D. students with an in-depth understanding of the Internet of Things (IoT) ecosystem, including device design, communication protocols, data acquisition, and modern network architectures such as cloud, edge, and fog computing. It emphasizes IoT applications across diverse domains, scalability and reliability considerations, and security frameworks and standards. By the end of the course, students will be able to design, implement, and secure IoT solutions for research and real-world applications
<b>Syllabus</b>	<p><b>1. Introduction to IoT (3 Hours)</b></p> <ul style="list-style-type: none"> <li>• Overview of Computer Networking and Internet Ecosystem</li> <li>• IoT Device Design and Development</li> <li>• IoT Communication Cycle</li> <li>• Applications of IoT Across Domains</li> <li>• Importance of Smart Infrastructure</li> </ul> <p><b>2. Sensors and Data Acquisition (3 Hours)</b></p> <ul style="list-style-type: none"> <li>• IoT Components and Scope</li> <li>• Role of Sensors in IoT Applications</li> <li>• Data Acquisition Techniques</li> <li>• Sensor Deployment and Monitoring Concepts</li> </ul> <p><b>3. IoT Communication Protocols and Standards (6 Hours)</b></p> <ul style="list-style-type: none"> <li>• 6LoWPAN and IoT Protocol Stack</li> <li>• Wireless Technologies for IoT</li> </ul>

	<ul style="list-style-type: none"><li>• Scalability and Reliability Considerations</li></ul> <p><b>4. Modern Network Architectures: Cloud, Edge, and Fog (3 Hours)</b></p> <ul style="list-style-type: none"><li>• Cloud Computing Fundamentals</li><li>• Edge and Fog Computing Concepts</li><li>• Cloud Services: SaaS, PaaS, IaaS</li><li>• Cloud Deployment Models: Public, Private, Community, Hybrid</li><li>• Cloud Architecture Standards (NIST, ITU-T)</li></ul> <p><b>5. <b>Course title</b>	AI and Creativity
<b>Lecturer</b>	Dario Costantino
<b>Scientific Discipline Sector</b>	CEAR-09/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year/Semester</b>	First/First
<b>Tentative Calendar</b>	15/01/2026 14.30-16.30 22/01/2026 14:30-17.30 29/01/2026 14:30-17.30 05/02/2026 14:30-17.30 12/02/2026 14:30-17.30 19/02/2026 14:30-17.30 26/02/2026 14:30-17.30
<b>SUMMARY /GOAL</b>	The course aims to equip students with both theoretical and practical tools to understand and effectively control artificial intelligence, integrating it within a structured and comprehensive creative process. Midjourney will serve as the primary platform for image generation, while additional forms of AI will be examined to illustrate their diverse applications across creative fields. The course will also include hands-on 3D modeling sessions using Rhinoceros and will address the ethical implications of AI, fostering a critical and informed approach to its use in design and visual communication.
<b>Syllabus</b>	<p><b>PROGRAM</b></p> <p><b>AI: global framework (theoretical session)</b></p> <ul style="list-style-type: none"> <li>• Basic notions (history and evolution of Artificial Intelligence in the creative field)</li> <li>• Types of AI, uses and experiences</li> <li>• AI and architectural design</li> </ul> <p><b>Midjourney (practical session)</b></p> <ul style="list-style-type: none"> <li>• What is Midjourney and comparison with other software (ChatGPT, ComfyUI, Nano Banana)</li> <li>• Use of the software (from basics to advanced commands)</li> </ul> <p><b>From the 2D image to the 3D model (practical session)</b></p> <ul style="list-style-type: none"> <li>• Generation and selection of the right image</li> <li>• Analysis and interpretation of the image (color theory and photographic composition)</li> </ul>

	<ul style="list-style-type: none"><li>• Realization of a 3D model starting from the selected image</li></ul>

CTI

<b>Course title</b>	Contextual Design and Heritage: identity and material culture of the territories
<b>Lecturer</b>	
<b>Scientific Discipline Sector</b>	CEAR-08/D
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The course aims to explore the role of design in the enhancement of material culture as recommended by the 2003 UNESCO Convention for the Safeguarding of the Intangible Cultural Heritage, with a particular focus on Southern Contexts. The “intangible cultural heritage means the practices, representations, expressions, knowledge, skills – as well as the instruments, objects, artefacts and cultural spaces associated therewith – that communities, groups and, in some cases, individuals recognize as part of their cultural heritage”. The Heritage dimension proposed by the UNESCO Convention is a “phenomenal extension” of the field of knowledge, conservation, enhancement and re-activation of material culture in which contextual design is developing a prominent role. Contextual Design is an important field of contemporary research developed in North Europe, in the Design Academy of Eindhoven. The aim is to investigate the meaning of the material and immaterial artifacts of design in relation to the identities of the territories and to the historical and cultural stratification that distinguishes them. Contextual Design and Cultural Heritage thus become a strategic combination to face the modern challenges of enhancing territorial contexts against the current phenomena of globalization and spectacularization of culture.</p>

CTI

<b>Course title</b>	Design for Historical and Contemporary Heritage Landscapes
<b>Lecturer</b>	Nicola Scardigno
<b>Scientific Discipline Sector</b>	CEAR-09/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The Faro Convention extends the idea of heritage from the architectural dimension to the dimension of city and landscape, recognizing together with the value of the single artifact the value of the relationship between artifacts in urban or natural context. Furthermore, the Convention consider as heritage non only the "extraordinary" but also the "ordinary" architecture, not only the ancient but also the 'modern' architecture. The notion of heritage landscape results from this new idea of heritage.</p> <p>The course will deal with the themes of the project for the preservation and valorization of the heritage landscapes, both historical and contemporary, both extraordinary and ordinary.</p> <p>The heritage landscapes are not only the archaeological and historical landscapes but also, for example, the urban landscape of the 'modern' city, that of the social housing district as well as that of the disused industrial plants.</p> <p>In this perspective, the course will deal with theories and design techniques useful for the transformation of the heritage landscapes, necessary to preserve, valorize and resignify them.</p>

<b>Course title</b>	Generative Algorithms: digital tools for parametric design and assessment of structures
<b>Lecturer</b>	Saverio Spadea
<b>Scientific Discipline Sector</b>	CEAR-07/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>New technologies are changing the way engineers work within the construction sector. Newly developed software solutions have provided effective methods to explore the design space at the interface between Structural Engineering and Architecture, allowing more efficient design strategies. The course aims to explore the potentials of new digital tools based on generative algorithms. The course is organized into four main parts in which both theoretical and practical aspects will be illustrated:</p> <ol style="list-style-type: none"> <li>1) Theoretical aspects of the Generative Scripting;</li> <li>2) Introduction of the Python interpreter component for Grasshopper (Rhino 3D), which allows to execution of dynamic scripts;</li> <li>3) Introduction to Structural Optimization;</li> <li>4) Workshop: the students will be divided into groups, and they would be defining helpful generative algorithms in their research topic.</li> </ol>

<b>Course title</b>	Historical research and study of the Ancient architecture
<b>Lecturer</b>	Antonio Fino
<b>Scientific Discipline Sector</b>	CEAR-11/A – ARCH-01/D
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>Ancient architecture is almost always in a state of ruin. His study, aimed at formulation of reliable hypotheses of reconstruction of the building, must be based on integrated survey methodologies that use the detailed analysis of the ancient ruined building as an essential knowledge base. They are taken into consideration therefore, besides to the observations derived from the results of the architectural survey, also any iconographic testimonies from other sources, such as vascular painting, frescoes, bas-reliefs, images on coins, etc. The building and its construction and morphological details, as well as, when present, his architectural sculpture must then be compared with others contemporary architectures, in order to include it in its historical-geographical context.</p> <p>The course therefore aims to present some completed or ongoing architectural research that can effectively illustrating the research method mentioned above. In particular, the following case studies will be addressed:</p> <ul style="list-style-type: none"><li>- The Arch of Trajan in Leptis Magna</li><li>- The reconstruction of urban planning of Kos</li><li>- The Curia in Leptis Magna</li><li>- Architectural sculpture in the anastylosis of ancient buildings</li><li>- Urban planning in Ionia and Caria between the archaism and the Hellenistic age</li><li>- Architectural and decorative models in the mausoleums of the imperial age in Libya</li><li>- The Hellenistic theatre in Mytilene</li><li>- The townscape in the figurative culture of Greek and Roman times</li><li>- The urban planning ant the agora of Byllis (Albania)</li></ul>

	- The Cistern in the agora of Byllis, analysis of the typology and of the constructive aspects.

<b>Course title</b>	Problems and methods of contemporary restoration
<b>Lecturer</b>	Rossella De Cadilhac
<b>Scientific Discipline Sector</b>	CEAR-11/B
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The educational objective of the course of Problems and methods of contemporary restoration is to illustrate the general lines of the main ways of understanding restoration and to provide PhD students with the historical-critical tools to develop an autonomous and conscious thought regarding the themes and nodes problematic of the discipline, with particular regard to the conceptual elaborations and experiences that open from the second post-war period to contemporary debate. There will be lectures and exercises, mutually complementary. Through the lectures the methods will be deepened, the knowledge of the theoretical and cultural foundations of restoration will be increased and strengthened and the ability to understand the conceptual nodes of the discipline will be developed in order to direct PhD students to achieve a capacity for critical re-elaboration of the acquired knowledge. Through the exercises the ability to apply knowledge and understanding will be developed and verified. The course is divided into two parts. The first part of the course will be divided into two thematic sections: the first will present the philosophical and cultural foundations of the discipline; in the second, some key issues of the contemporary debate will be addressed, such as the relationship between "restoration and creativity" in the "old and new" dialectic. The second part will be dedicated to exercises. These will take place in the form of discussions which, through comparison, will help PhD students acquire an autonomous ability to apply the knowledge acquired through analytical and critical tools useful for interpreting the different theoretical positions and evaluating their operational implications. The attribution of training credits will take place through a final test, aimed at verifying the acquisition</p>

	of knowledge and skills by the PhD student. The assessment will also take into account participation in the training activities carried out.

<b>Course title</b>	Theories and methods of design for the Antique
<b>Lecturer</b>	Antonio Nitti
<b>Scientific Discipline Sector</b>	CEAR-09/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	The first part will be structured into four thematic sections: the first, by investigating the contributions offered by the Masters of Architecture between the XIX° and XX° centuries and deducing their theoretical background, will try to outline the general principles underlying the main points of view that connote contemporary architectural research; the other three will be thematically articulated and focused on the relationships between "Antique and Landscape", "Antique and City", "Renovation and Museography", and will see the compositional analysis of some exemplary contemporary works, in order to recognize methods and techniques of the design for the Antique. The second part will be devoted to the exercises. They will be carried out in the modality of an intensive design workshop, dealing with and developing a project concerning the main topics of the course.

<b>Course title</b>	Theories and techniques of the project for the fragile cities and territories
<b>Lecturer</b>	Giuseppe Tupputi
<b>Scientific Discipline Sector</b>	CEAR-09/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The recent disastrous phenomena, accentuated by atmospheric changes as well as by neglect and improper transformation processes, have highlighted the fragility of our cities and our territories, especially those of the so-called "inland areas". The awareness that not only human lives and production activities are at risk but also the identity of the places is growing stronger and, for this reason, a paradigm shift for the safety and risk mitigation project is required. The course will illustrate an innovative approach aimed to combine Safety and Identity, based on the conception of the project of mitigation of risks (seismic, hydrogeological) as an opportunity of strengthening of the identity characters of fragile cities and territories. According to this approach, the safety works built in order to mitigate the hydrogeological risk can define a place in the landscape as well as "monumentalize" its natural forms. The project of mitigation of the seismic risk of the urban fabric of the Apennine cities could be an occasion to renovate the form of the city itself and its spaces.</p> <p>Indeed, combining safety and identity means convert the technical forms of the safety project into architectural forms, capable to exalt the characters of the places that they transform.</p>

CTI

<b>Course title</b>	Theory of Formativeness
<b>Lecturer</b>	Carlo Moccia
<b>Scientific Discipline Sector</b>	CEAR-09/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>It seems lost today, in architecture as generally in arts, a unitary point of view on which to found a theory on. That civil conscience that has always been the basis of the art of building seems no longer part of the collective heritage. This condition is recognizable in the contradictory experience of contemporary architecture.</p> <p>For this reason, the class aims to try to outline a "classical" theory of architectural research; a classicism that does not renounce, rather it investigates, the culture of modernity, trying to measure itself against this alleged contradiction.</p> <p>All the architecture that we can include within the "classic" experience (that we can also define "rational experience") is characterized by a peculiarity: the intelligibility of forms, along with we define a method of formativeness.</p> <p>According to this idea of architecture, there's no advancement of forms without an advancement of knowledge - without an increasingly higher level of self-awareness.</p> <p>Hence the need for a theory of architectural research.</p> <p>The method of formativeness we want to investigate regards three major chapters of architecture:</p> <p>The relationship among architecture, city and landscape;</p> <p>The "construction issue";</p> <p>The question of the project with the Ancient.</p>

## DAUSY

<b>Course title</b>	Deep Reinforcement Learning for Control of Autonomous Systems
<b>Lecturer</b>	Gaetano volpe
<b>Scientific Discipline Sector</b>	IINF-04/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year/Semester</b>	First/First
<b>Tentative Calendar</b>	10/03/2026: 11.00-13:00 12/03/2026: 11.00-13:00 17/03/2026: 11.00-13:00 19/03/2026: 11.00-13:00 24/03/2026: 11.00-13:00
<b>SUMMARY /GOAL</b>	<p>Reinforcement learning deals with solving sequential decision problems when minima prior information is available. Solving sequential decision problems means finding their optimal control policies. Using reinforcement learning algorithms, the optimal policy is learned through the cooperation between the agent (or controller) and the system to be controlled. Deep Reinforcement Learning (DRL) is a subfield of machine learning that combines reinforcement learning (RL) and deep learning. The course will propose the main modeling frameworks, investigate the most relevant deep reinforcement learning techniques and show some interesting applications.</p>
<b>Syllabus</b>	<p>This course introduces the fundamental concepts and methods of Reinforcement Learning (RL) and Deep Reinforcement Learning (DRL), focusing on sequential decision-making problems where limited prior information is available. Students will learn how agents interact with environments to learn optimal control policies and how deep learning techniques enable RL to scale to complex, high-dimensional settings. The course presents the main modeling frameworks, key DRL algorithms, and representative applications in fields such as robotics, control, games, and resource management.</p> <p>Topics:</p> <ul style="list-style-type: none"> <li>• Reinforcement Learning basics and Markov Decision Processes (MDPs)</li> <li>• Dynamic programming and model-free RL methods (Monte Carlo, TD learning, Q-learning)</li> <li>• Deep learning foundations for RL</li> </ul>

	<ul style="list-style-type: none"><li>• Deep value-based methods (DQN and extensions)</li><li>• Policy gradient methods and actor–critic algorithms (A2C/A3C, DDPG, PPO, SAC)</li><li>• Exploration strategies and stability considerations</li><li>• Applications of DRL in real-world systems</li></ul> <p>By the end of the course students will be able to:</p> <ul style="list-style-type: none"><li>• Model sequential decision problems using RL frameworks</li><li>• Implement and analyze major DRL algorithms</li><li>• Apply DRL techniques to practical control and decision making tasks</li><li>• Understand current challenges and research directions in the field</li></ul>

## DAUSY

<b>Course title</b>	Dynamical stochastic models of biological systems
<b>Lecturer</b>	Pasquale Palumbo
<b>Scientific Discipline Sector</b>	IINF-04/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	This course gives the mathematical tools to model and analyze most common biological frameworks such as chemical reactions and gene transcription networks, according to the stochastic approach of the Chemical Master Equations.
<b>Syllabus</b>	
<b>Bibliography</b>	
<b>Examination method</b>	
<b>Room</b>	On-site / Microsoft Teams

## DAUSY

<b>Course title</b>	Modeling and simulation of biosystems
<b>Lecturer</b>	Alessandro Borri
<b>Scientific Discipline Sector</b>	IINF-04/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	This course provides mathematical tools to model, analyze, simulate, and control biological and medical systems, primarily within a deterministic framework. By the end of this course, students will be able to model such systems and implement simulation models using Matlab.
<b>Syllabus</b>	
<b>Bibliography</b>	
<b>Examination method</b>	
<b>Room</b>	On-site / Microsoft Teams

## DAUSY

<b>Course title</b>	Modeling and Simulation of Smart Energy Systems
<b>Lecturer</b>	Michele Roccotelli
<b>Scientific Discipline Sector</b>	IINF-04/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	The course will focus on techniques and tools for the modeling and simulation of energy systems in smart buildings and smart mobility applications. By the end of this course students will achieve the basics of how to model and simulate these energy systems using engineering tools (e.g., Matlab, SUMO). Each lesson will include both theoretical lecture and hands-on software exercises.
<b>Syllabus</b>	
<b>Bibliography</b>	
<b>Examination method</b>	
<b>Room</b>	On-site / Microsoft Teams

## DAUSY

<b>Course title</b>	Optimal control for Climate change and air quality
<b>Lecturer</b>	Claudio Carnevale
<b>Scientific Discipline Sector</b>	IINF-04/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	The course will address the fundamentals of the modelling and control of real-world systems, presenting the application of control theory to climate change and air quality. Each lesson shall consist in lecture and numerical examples.
<b>Syllabus</b>	
<b>Bibliography</b>	
<b>Examination method</b>	
<b>Room</b>	On-site / Microsoft Teams

## DAUSY

<b>Course title</b>	Simulation Systems for Engineering Applications
<b>Lecturer</b>	Nicola Mignoni
<b>Scientific Discipline Sector</b>	IINF-04/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	The course shall address the basis of simulation techniques for engineering applications, with a focus on the underlying mathematical formalism. At end of this course students will be able to deal with system modeling and to implement simulation models in engineering tools (e.g., Python, Matlab). Each lesson shall consist in lecture and numerical examples.

## DRIEI

<b>Course title</b>	Fundamentals of Information Security and Data Privacy
<b>Lecturer</b>	
<b>Scientific Discipline Sector</b>	IINF 05/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>This course delves into the dynamic interplay between Artificial Intelligence (AI), Machine Learning (ML), and data security and privacy, highlighting both the challenges and opportunities these technologies present. The rapid advancements in Information and Communication Technologies (ICTs) are transforming society, delivering profound societal and economic benefits. This evolution is fueled by the vast availability of rich, heterogeneous data and the pervasive adoption of AI-ML approaches for data generation, analysis, and processing.</p> <p>However, this technological leap presents a double-edged sword in the realm of data protection. On one hand, AI-ML applications introduce new privacy and security risks, such as potential data exposure during the learning process or vulnerabilities like data poisoning attacks, which can compromise model accuracy and integrity. On the other hand, AI-ML techniques also offer transformative opportunities, enabling innovative solutions for cybersecurity and privacy-preserving data sharing.</p> <p>This course offers a comprehensive overview of the research issues, challenges, and opportunities at the intersection of AI-ML, data security, and privacy. Participants will explore the dual nature of AI-ML's impact, gaining insights into both the potential threats and the groundbreaking solutions it can provide for safeguarding information in the era of smart technologies.</p> <p>The course combines theoretical lectures with practical insights. Participants will engage with real-world case studies and hands-on sessions, enabling them to implement and</p>

	evaluate interpretability techniques. A final project will require students to analyze a case study using the acquired knowledge and tools.

<b>Course title</b>	Mechatronic Systems
<b>Lecturer</b>	
<b>Scientific Discipline Sector</b>	IINF-04/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>This class provides the PhD students with analytical tools to model and simulate interconnected multi-physical dynamic systems, with a focus on mechatronic systems and actuator applications. A generalized modeling framework will be initially presented to describe engineering systems across different physical domains (e.g., mechanical, electrical, magnetic, fluidic, thermofluidic). A port-based modeling perspective will be introduced, which exploits the concept of energy to model the physical interconnection among various subsystems in a universal and coherent way. Based on the derived framework, basic mathematical models of different types of electrostatic, electromagnetic, hydraulic, and pneumatic mechatronic systems will be derived. In parallel to model development, basic technological aspects of each class of mechatronic systems and actuators will be discussed, and the most common physical components and applications will be presented. At the end of the PhD class, the students will be able to model and simulate complex mechatronic systems consisting of the interconnection of several components with a unified thermodynamic framework, and will have a basic understanding of the operating principles of the most common types of mechatronic actuator technologies.</p>

## DRIG

<b>Course title</b>	A user- centered approach to Ergonomics assessment in the Industry 5.0 paradigm
<b>Lecturer</b>	Vito Modesto Manghisi
<b>Scientific Discipline Sector</b>	IIND-03/B
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The Industry 4.0 program and the perspectives of the innovative I5.0 approach are significantly changing the role played by the operator on the smart factory shopfloor. The introduction of the mass-customization paradigm and the fast changes in the production cycle require new operators' capabilities. In particular, the I4.0 operator is requested to be a smart element in the production cycle, able to adapt to sudden changes by means of decisional capabilities. In order to strengthen such capabilities, it is necessary to optimize the working conditions so as to free operators from unnecessary tasks and allow them to use their physical and cognitive resources in an optimal manner. The Human Performance Envelope (HPE) constitutes the set of factors that define the conditions in which the operator acts and encompasses environmental, social, physical, and cognitive aspects. In order to optimize the operator's performance, it is essential to understand the processes that govern the definition of the HPE, thus allowing both designing efficient solutions and applying rigorous validation procedures. Thanks to technological innovations (e.g. low-cost tracking systems and physiological signals platforms), nowadays it is possible to apply an integrated approach for the HPE assessment using both traditional and novel methods. The course will be composed of 3 modules aiming at providing Ph.D. students with the necessary knowledge to validate in their scientific research the effectiveness of solutions designed in order to improve the operator's performance with particular attention to the HPE. Module I. Introduction and theoretical bases. The role of the Operator in the I4.0 smart factory. Introduction to the concept of HPE and its fundamental compo-</p>

	<p>nents —the physical and the cognitive workload. Basic principles of the Cognitive Load Theory. The ISO standard 11226 Ergonomics — Evaluation of static working postures. Module II. Assessment methods for physical ergonomics. Post-hoc measures (the Borg-CR 10 scale), direct methods, observational methods (the Rapid Upper Limb Assessment metrics), and innovative applications for the observational methods (the ErgoSentinel tool). Module III. Assessment tools for cognitive ergonomics. Post-hoc measures (the NASA Task Load Index, the Multiple Resource Questionnaire), task performance measures (Completion time, Error Rate, reaction Time, the dual-task design); direct methods (the electrocardiographic signal and the Heart Rate Variability Analysis approach). By the end of the course, Ph.D. students will have a broadened knowledge in the field of the Industry 4.0 paradigm through the awareness of the new role of the operator and the knowledge of the HPE concept. Furthermore, they will be able to handle tools for physical and cognitive workload assessment and for designing an experimental setup in order to validate innovative solutions for HPE improvement.</p>

<b>Course title</b>	Advanced Additive Manufacturing and Reverse Engineering design and processes for the twin transition
<b>Lecturer</b>	
<b>Scientific Discipline Sector</b>	IIND-04/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	The course aim to provides PhD students with the knowledge about advanced Additive Manufacturing (AM) and Reverse Engineering (RE) processes mainly for new Repairing/Remanufacturing more sustainable solutions in circular industrial economy. In fact, the new Additive Manufacturing methods offer the best value-added, resource-efficient approach to end-of-life product recovery. The course project will be articulated in different topics: 1. Direct Energy Deposition (DED) solutions for repair and life extension. Among DED processes, Laser Powder Metal Deposition will be analysed in more detail because of its enormous capabilities, flexibility and efficiency.

<b>SUMMARY /GOAL</b>	This course introduces the fundamental concepts of elementary probability theory and statistical inference.
<b>Syllabus</b>	(CDF), discrete uniform, Bernoulli, binomial, geometric, negative binomial, Poisson distributions and Poisson approximation to the binomial. Continuous random variables: probability density functions (PDF), cumulative distribution functions, uniform, exponential, normal (Gaussian), log-normal distributions, transformations of random variables, Jacobian method, central limit theorem and Gaussian approximation to the binomial. Properties of distributions: expectations, mean, mode, median, variance, higher moments, central moments, skewness, kurtosis, quantiles, percentiles, moment-generating functions, characteristic functions, cumulant generating functions. Inequalities and further distributions: Markov's and Chebyshev's inequality, weak law of large numbers, gamma, chi-squared, Student's t, Fisher-Snedecor F distributions and their relationships. Joint distributions: joint probability mass functions, joint probability density functions, marginal distributions, expected values, independent random variables, covariance, correlation, functions of multiple random variables, conditional distributions. Statistical inference:

	sample statistics, distribution of sample mean, sampling variability, estimators and their properties (consistency, bias, efficiency), Cramer-Rao lower bound, standard errors, maximum-likelihood estimation, method of moments, Fisher information. Confidence intervals: interval estimation, pivotal quantities, confidence intervals for normal parameters and proportions, one sided confidence intervals. Regression analysis: simple and multiple linear regression, least squares estimation, properties of regression estimators, confidence intervals in regression. Hypothesis testing: principles, simple and composite hypotheses, significance levels, power, Type I and Type II errors, p-values, test statistics, tests for means and proportions, analysis of variance (ANOVA), goodness-of-fit testing.

<b>Course title</b>	Mathematical methods in deep learning
<b>Lecturer</b>	Gianluca Orlando
<b>Scientific Discipline Sector</b>	MATH-03/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year/Semester</b>	First/First
<b>Tentative Calendar</b>	20/01/2026: 14.30-17:00 22/01/2026: 14.30-17:00 27/01/2026: 14.30-17:00 29/01/2026: 14.30-17:00 03/02/2026: 14.30-17:00 05/02/2026: 14.30-17:00 10/02/2026: 14.30-17:00 17/02/2026: 14.30-17:00
<b>SUMMARY /GOAL</b>	<p>This course, intended for Engineering Ph.D. Students, has the objective to provide the basic mathematical concepts needed to have a clear insight of the mechanism of neural networks in deep learning. This will help engineers in exploiting neural networks as a tool in a conscious way. The theory treated in the course is the following. 1) We will start by introducing the basic architecture of a feedforward neural network defined basing on weights. For this, we shall recall some basic facts in tensor algebra. 2) We will explain some examples of Universal Approximation Theorems, highlighting the ideas behind the fact that a neural network is capable to approximate any continuous function. 3) We will introduce the concept of cost in a feedforward neural network, providing some examples of nonlinear costs. Among these, we will put some stress on the cross-entropy cost, recalling some basic facts in statistics about maximum likelihood estimation. 4) We will introduce some numerical methods for nonlinear optimization: the gradient descent, stochastic gradient descent, momentum update. 5) We will explain how all the previous ingredients are combined together in the feedforward-backpropagation algorithm used for data-driven learning. In parallel with the theory, we will illustrate how to implement it using the PyTorch library in some educational examples in image recognition and language models, putting some stress on the process of</p>

	<p>babysitting a neural network (initialization, normalization, checking overfitting). Projects proposed by the Ph.D. Students will be strongly encouraged.</p>
<b>Syllabus</b>	<p>The course will start with a general introduction to the objectives of data-driven machine learning and by explaining where neural networks and deep learning fit in this general framework. Then we will move on to the description of the basic building blocks of neural networks. We will introduce the concept of perceptron and of sigmoid neuron, and we will explain how these simple models can be used to build complex neural networks, with a gentle introduction to loss functions and the backpropagation algorithm. This will allow us to build a simple neural network that recognizes handwritten digits from the MNIST dataset with the aid of the Py-Torch library from Python. With this concrete example in mind, we will discuss in detail some of the most important key aspects of neural networks.</p> <p>We shall give an idea of the proof of the Universal Approximation Theorem, explaining how neural networks are able to approximate any continuous function. The proof will highlight the importance of the non-linearity in the activation functions of neural networks. Then we will refer to some results in the literature that show the benefits of using deep neural networks over shallow ones.</p> <p>Next, we will move on to the choice of the loss function, discussing the choice of cross-entropy and log-likelihood loss functions. For this, we will recall some basic concepts of information theory and maximum likelihood estimation in statistics.</p> <p>After the choice of the loss function, we will discuss the optimization of weights in neural networks. We will introduce, in a general setting, the algorithm of gradient descent, explaining how it is used to minimize functions. We will discuss pros and cons of the basic gradient descent algorithm. Then we will introduce in detail the algorithm used in practice to optimize the weights of neural networks, the stochastic gradient descent algorithm. Finally, we will discuss some of the most important variants of this algorithm, such as momentum update.</p> <p>With these tools in hand, we will build a simple neural network from scratch.</p>

	<p>We will move on to regularization techniques in neural networks, discussing the concepts of regularization and drop-out. Moreover, we will discuss the problem of vanishing and exploding gradients in deep neural networks, and we will introduce the concept of batch normalization, explaining how it can be used to mitigate these problems.</p> <p>If time permits, we will discuss some further topics in deep learning, such as convolutional neural networks for image recognition and natural language processing. A lecture will be dedicated to the question of how neural networks represent features in the data, discussing the concept of superposition of features and the Johnson-Lindenstrauss lemma.</p>

## DRIG

<b>Course title</b>	Metaverse Integration for Digital Transformation of industry
<b>Lecturer</b>	Alessandro Evangelista
<b>Scientific Discipline Sector</b>	IIND-03/B
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>This course provides an in-depth exploration of the metaverse as a fundamental catalyst for digital transformation in an increasingly evolving industrial context. Balancing theory and practice, participants are guided through a series of modules designed to provide a comprehensive and applied understanding of key concepts.</p> <p>The introduction will outline the fundamental importance of the Metaverse in the context of the Digital Transition. The first module will explore the history and development of metaverse technologies. A clear distinction will be made between virtual reality, augmented reality and the metaverse concept itself.</p> <p>The second module, through the study of successful cases and the analysis of successful implementation strategies, will explore the practical applications of the metaverse in a business context.</p> <p>The third module will provide an overview of enabling technologies. It will examine how Artificial Intelligence and Blockchain can empower the Metaverse and accelerate the digital transition.</p> <p>The fourth module is highly practical. It will guide participants in designing immersive experiences and developing a strategic plan for integrating the metaverse into the corporate environment. Hands-on experience will be provided through practical sessions using virtual reality metaverse development platforms such as the Unity game engine.</p> <p>The course conclusions will summarise the acquired knowledge and prepare the participants for the final project. The aim of this assignment is to develop a practical project that applies the concepts of Digital Transition through the metaverse. After completing the course, the theoretical and</p>

	<p>practical learning will be reinforced by presenting and evaluating projects.</p> <p>The course aims to train participants as informed Digital Transition leaders, equipped with the skills to fully exploit the potential of the Metaverse in the business domain, through theoretical lectures and practical sessions.</p>

## DRIG

<b>Course title</b>	Smart sustainable manufacturing
<b>Lecturer</b>	
<b>Scientific Discipline Sector</b>	IIND-04/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The major issue of sustainable manufacturing activities is the management of useful information: the way we choose data to measure may strongly change the perception of its nature and influence. Thus sustainability, which is an emerging paradigm in manufacturing, is now leading the most of the scientific efforts in defining the assessment of sustainability and the collection of significant measures of transition toward actions that satisfies the economic, environmental, social and technological targets.</p> <p>Smartness paradigm in manufacturing, on the other hand, is deeply tied to the information management and use, provided the Digital Twins as well as Cyber Physical Systems are mostly based on data get from sensing systems and on their elaboration to predict the evolution of systems simulated.</p> <p>The class will bring the students to understand the main driving issues in assessing and managing sustainable manufacturing in the light of a smart transition. At the same time will put major issues to come in order to stimulate students in their scientific career to deepen open issues still remaining on the subject from a technological perspective.</p> <p>Contents</p> <p>1CFU.</p> <p>Manufacturing processes and the main factors of production: material and energy. Manufacturing and sustainability. Production systems and their sustainable management.</p> <p>Smart manufacturing paradigms: 4.0 and 5.0.</p> <p>1CFU</p> <p>Criteria for modeling manufacturing processes and their critical variables.</p> <p>Cyber Physical System and Cyber Physical Social System.</p>

	Measurement of the ecological footprint of a process: carbon and water footprint. Sustainability Assessment of manufacturing processes based on 1 and 2nd law of thermodynamics.

## DRIG

<b>Course title</b>	Technological changes and transition perspective
<b>Lecturer</b>	Vito Albino
<b>Scientific Discipline Sector</b>	IEGE-01/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The technological change is continuously increasing its pace. New technologies and business models are impacting the economic and social systems in a deep and unexpected way as well as social systems are adapting and reacting to these changes.</p> <p>The aim of the course is firstly to adopt the epistemological point of view for the technological determinism to examine how technology, economy, and society interact each other when a change in technology occurs. Some cases will be presented and discussed (asbestos cement, iron, and automotive technologies).</p> <p>Then, the transition perspective is presented to explain how such changes can determine long-term and wide impact. The type and nature of the transition are discussed. The structural and ideological nature of a transition will be described to support a full understanding of the phenomena. Some tools to operationalize ideologies are introduced. The green and digital transition will be examined adopting this perspective. A specific analysis for the transitions towards the smart city and the new space economy will be discussed with students.</p>

## DRIME

<b>Course title</b>	Acoustics and thermoacoustics
<b>Lecturer</b>	Davide Laera
<b>Scientific Discipline Sector</b>	IIND-06/B
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>Coupling between acoustic waves and flames has become a central issue in the development of many modern combustion systems because of both environmental issues (noise) and the destructive interactions which acoustics can generate in combustors. Numerical tools are essential in many flames/acoustics studies but a theoretical background in acoustics and especially in acoustics for reacting flows is mandatory to tackle such problems. This course presents the fundamental concepts of acoustics and thermo-acoustic instabilities together with instability control strategies. Possibilities of data-driven approach for optimal design of stable combustion chamber will be also presented. The course is an alternation of theoretical presentations and practical work. It is divided into 5 lectures and a practical hands-on.</p> <ol style="list-style-type: none"><li>1) Fundamental of acoustics: theory, modelling and measurement techniques.</li><li>2) The thermoacoustic combustion instabilities</li><li>3) Flames as acoustic element: Flame transfer functions/Flame describing functions</li><li>4) Controlling of thermoacoustic instabilities: passive and active control strategies</li><li>5) Data-driven methods for optimal design.</li><li>6) Simple hands-on.</li></ol>

## DRIME

<b>Course title</b>	Hydraulic Turbomachines for Energy Recovery in Water Distribution Networks
<b>Lecturer</b>	Michele Stefanizzi
<b>Scientific Discipline Sector</b>	IIND-06/B
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>Water Distribution Networks (WDNs) represent a noteworthy field for possible implementation of Small Hydropower (SHP). Indeed, WDNs experience considerable water leakages due to their age and water management authorities often divide the WDNs by inserting Pressure Reducing Valves (PRVs), which waste a potentially recoverable hydraulic head. The replacement of PRVs with turbomachines can be considered as an economically feasible solution to achieve both an effective pressure control and an energy recovery, otherwise wasted.</p> <p>In this framework, the course aims to provide criteria for selecting and predicting the performance of hydraulic turbomachines for energy recovery in water distribution networks.</p> <p>The course starts with an overview on the global scenario of renewable energy sources. In particular, hydropower sector will be deepened ranging from the large hydropower to the small/mini hydropower and its potential.</p> <p>Then, the available technologies to exploit hydraulic energy in water distribution networks will be illustrated (i.e., Pumps as Turbines (PaTs), Cross-flow turbines, Energy harvesting valves, etc.).</p> <p>Afterwards, PaTs will be investigated. After the analysis of the state of the art, the course will present performance prediction models (both theoretical and empirical).</p> <p>Cross-flow turbines and energy harvesting valves will be discussed in terms of performance curves and regulation techniques.</p>

	<p>Subsequently, the course will focus on methods for the selection of the proper machine for a specific WDN. Then, different case studies will be analyzed in terms of energy production and economic feasibility.</p> <p>The last part of the course will be focused on how to experimentally investigate a Pump as Turbine. In particular, the hydraulic turbomachinery lab (PoliBa) will be described. Then, the experimental characterization of a PaT selected for a WDN will be illustrated.</p>

## DRIME

<b>Course title</b>	Hydrogen for Sustainable Transportation Systems
<b>Lecturer</b>	Gianmarco Saponaro
<b>Scientific Discipline Sector</b>	ING-IND/08
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>Hydrogen can play a significant role in the decarbonization process of hard-to-abate transport sectors such as heavy and long-distance road transport and maritime mobility, where electrical transportation is not technically viable.</p> <p>Hydrogen may be used either to feed fuel cells (FCs) or burned inside ICE. The current state hydrogen FC technology is expensive and requires pure hydrogen. Furthermore, large batteries are needed to cope with the transient nature of power demands for vehicle applications, reducing the overall efficiency.</p> <p>ICEs can be fueled with non-purified hydrogen, resulting in significantly lower production cost of hydrogen fuel. Furthermore, they can take advantage of the existing advanced combustion and engine control technologies.</p> <p>The course proposes an overview of both technologies, considering their pros and cons. The course delves into the aspects related to the configuration of propulsion systems, power management systems, storage systems, as well as the problems of deterioration of fuel cells and hydrogen embrittlement.</p>

<b>Course title</b>	Introduction to fluid-structure interaction
<b>Lecturer</b>	
<b>Scientific Discipline Sector</b>	IIND-01/F
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	The objective of this course is to deliver the key topics concerning Fluid-Structure Interaction (FSI) problems for bio-physical and engineering applications. The students are expected to understand the mechanisms underlying the fluid-elastic effects in microscopic and human-scale applications, with the respective modelling approaches. The course will focus on simplified, low-dimensional models containing key aspects of real-world problems. Reference applications include bacterial locomotion, aeroelastic phenomena on airfoils, flow-induced vibrations of bridge decks, vibrations of conveying pipes. Numerical solutions will be addressed by means of a Matlab implementation.

<b>Course title</b>	Offshore Wind Technologies
<b>Lecturer</b>	Sergio Mauro Camporeale
<b>Scientific Discipline Sector</b>	IIND-06/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	Offshore wind energy has the potential to integrate a large part of the renewable electric energy that will be produced in the coming Years to meet the objectives of reducing global CO2 emissions. For Italy in particular, interest is focused on floating turbine technologies, which can play an important role in industrial development, with the integration of blue economy activities in ports and at sea. However, floating wind turbines still require fundamental research on platforms, turbines and mooring technologies to make them fully competitive for use in the Mediterranean, where wind speeds and sea states are lower than in northern Europe. The course provides an overview of floating turbine technologies, considering their advantages and disadvantages and their possible integration with other offshore power generation systems such as wave energy converters and floating photovoltaic platforms. The course covers aspects related to digital tools for identifying areas suitable for the development of marine renewable energy sources, tools for performance analysis and simulation, ranging from simplified models based on BEM to more accurate CFD simulations.

## DRISS

<b>Course title</b>	Construction safety: legal and administrative aspects, technical standards (part one of three)
<b>Lecturer</b>	Mario Daniele Piccioni
<b>Scientific Discipline Sector</b>	CEAR-06/A – GIUR-14/A
<b>Hours of instruction</b>	30 (10 Modulo A: STRUCTURAL ENGINEERING CEAR-06/A)0
<b>CFU</b>	3 (1 Modulo A: STRUCTURAL ENGINEERING CEAR-06/A)
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	Nowadays, the structural safety of constructions is a key problem, especially for critical infrastructures like bridges, industrial and energy production plants, etc.. Indeed, eventual collapses may involve risks not only for human lives but also for the preservation of the environment. This course proposes a multidisciplinary approach for giving effective answers to the safety of construction problems, involving different points of view, coming from the fields of structural engineering, technical standards, and legal aspects.

<b>Course title</b>	Energy Production: Storage, Emerging Technologies & Social Challenges
<b>Lecturer</b>	Valeria Selicati
<b>Scientific Discipline Sector</b>	IIND-07/A– IEGE-01/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2 (Modulo A: 1 IIND-07/A+ Modulo B: 1 IEGE-01/A )
<b>Year/Semester</b>	First/Second
<b>Tentative Calendar</b>	08/09/2026: 9.30-12:00 10/09/2026: 9.30-12:00 15/09/2026: 9.30-12:00 17/09/2026: 9.30-12:00 22/09/2026: 9.30-12:00 24/09/2026: 9.30-12:00 28/09/2026: 9.30-12:30 30/09/2026: 9.30-12:30
<b>SUMMARY /GOAL</b>	<p>This SCUDO course will deepen the fundamentals of distributed energy production and distribution of energy. The course aims to provide PhD students with methodologies to support a renewable energy transition for renewable energy communities (REC) looking at investigated in three different modules, emerging technologies for energy production (1), the energy storage opportunities and technologies (2) and social aspects behind the implementation of practices of (REC).</p> <p>The course will provide the tools to carry out an evaluation of the use of energy resources, making the PhD students aware of the methodologies for carrying out an energy production and management systems.</p> <p>The course therefore aims to provide specific technical knowledge on the application and use of the main renewable energy sources, encouraging critical development towards a path aimed at the efficient use of energy resources. During the course, through case studies, the ability to propose both managerial and technological-system interventions will be developed, and advanced tools for visualizing energy consumption will be presented, facilitating its monitoring.</p>
<b>Syllabus</b>	The course provides an overview of distributed and renewable energy production, storage technologies, and the social

	<p>dimensions of energy transition. It is structured into three macro-areas:</p> <ol style="list-style-type: none"><li>1. <b>Emerging Technologies</b> – renewable sources, hydrogen, e-fuels, and innovative energy conversion systems;</li><li>2. <b>Energy Storage</b> – electrical, thermal, and chemical storage technologies and their role in balancing renewable generation;</li><li>3. <b>Social &amp; Economic Challenges</b> – community engagement, social acceptance, behavioral change, governance models, and policy frameworks for Renewable Energy Communities (RECs).</li></ol> <p>Through lectures and case studies, PhD students will develop analytical and critical skills to design sustainable energy systems integrating technical innovation with societal needs.</p>
<b>Bibliography</b>	Scientific papers, slides and support material from the lecturer
<b>Examination method</b>	Oral presentation of the project work

<b>Course title</b>	Innovative devices for seismic risk protection
<b>Lecturer</b>	Armando La Scala
<b>Scientific Discipline Sector</b>	CEAR-07/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	This course will introduce the use of innovative devices for seismic risk protection of Reinforced Concrete (RC) structure. In particular, the retrofitting of the latter will made using hybrid technological systems based on laminated timber panels. The main goals will be the evaluation of the structure's response and the consequent reduction of seismic risk.

## DRSATE

<b>Course title</b>	Adaptive Building Technologies for the Mitigation of Local and Global Climate Change
<b>Lecturer</b>	Ludovica Maria Campagna
<b>Scientific Discipline Sector</b>	CEAR-08/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The aim of the course is to provide students with the knowledge of the effects of climate change and Urban Heat Island (UHI) on built environment. The course will also provide detailed knowledge on the techniques and technologies to adapt the building fabrics to the effects of climate change and UHI and to counterbalance the temperature increase. The first part of the course will explore in detail the major issues of urban climatology, helping in defining the interaction between environmental variables, outdoor surfaces and building fabrics. In the second part of the course detailed students will investigate in detail adaptive technologies to mitigate the temperature effects of climate change-related phenomena. Examples from successful real case studies will be shown. Finally, the third part of the course will provide students with a hands-on experience of modelling techniques and tools to simulate the thermal characteristics of cities and buildings and assess the impact of adaptation technologies. The assessment will be based on the modelling of a selected case study and on the analysis of the effects of different adaptation technologies.</p>

## DRSATE

<b>Course title</b>	Bio-residues and geomaterials for sustainable engineering: from multiscale characterisation to mechanical improvement
<b>Lecturer</b>	Rossella Petti
<b>Scientific Discipline Sector</b>	CEAR-05/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The sustainable use of resources is a crucial aspect in a scenario of exponential increase in their consumption, driven by a growing global population and a continually accelerating global economy. It is therefore a duty for today's researchers to find out new strategies that enable such development while minimizing the consumption of the planet's primary resources. This approach, inspired by principles of circular economy and sustainability, can be applied to various fields of engineering. Specifically, scientific approaches will be presented to implement more sustainable management of different residues, mainly of marine origin, such as shells, dredged soils, algae, and seagrass. Dredged sediments, for example, are one of the most environmentally impactful natural materials to be managed nowadays due to the massive amounts that are dredged periodically in Europe (approximately 200 million m<sup>3</sup> per Year), both to ensure the effective functioning of activities in port areas and, when contaminated, for remediation of polluted sites. In this context, various studies anticipate their mechanical improvement using traditional binders, such as cement that is the source of about 8% of the world's carbon dioxide (CO<sub>2</sub>) emissions. The course will showcase recent approaches paving the way to transform these residues into new secondary raw materials useful for various industrial sectors. In detail, the geo-chemo-hydro-mechanical characterisation at multiple investigation scales of both the residues to be treated and the new geomaterials produced will be presented, in order to identify the reuse potential of the waste soils beforehand and the geo-mechanical performance of the new geo-material afterward, depending on the intended use.</p>

	Examples of products and applications in different industrial fields. Case studies and ongoing- EU projects related to the specific topic

<b>Course title</b>	Deep learning applications for Engineering Geology
<b>Lecturer</b>	Angelo Doglioni
<b>Scientific Discipline Sector</b>	GEOS-03/B
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year/Semester</b>	First/First
<b>Tentative Calendar</b>	02/03/2026: 10.00-13:00 04/03/2026: 10.00-13:00 09/03/2026: 10.00-13:00 11/03/2026: 10.00-13:00 16/03/2026: 10.00-13:00 18/03/2026: 10.00-13:00 23/03/2026: 10.00-12:00
<b>SUMMARY /GOAL</b>	<p>The course introduces deep learning techniques for Engineering Geology, focusing on recognizing landslide-prone areas and modeling aquifer responses to rainfall. It will use convolutional neural networks to identify landslide areas through geological and geomorphological data and orthophotos, training algorithms to detect and delineate susceptible regions. For aquifer recharge modeling, Multi-Objective Evolutionary Polynomial Regression will formulate responses to rainfall, alongside evolutionary neural networks.</p> <p>Goals: Equip doctoral students with AI knowledge for modeling engineering geology phenomena to prevent environmental risks.</p> <p>Knowledge and Understanding: Students will gain insights into advanced modeling paradigms in environmental geology, enhancing the understanding of complex geological and hydrogeological phenomena beyond traditional methods.</p> <p>Application Skills: Students will apply deep learning and machine learning techniques to comprehend and mitigate environmental risks.</p>

	Expected Outcomes: Students will become familiar with AI-based data modeling techniques and will be able to implement basic deep learning paradigms using pre-developed tools for geological-environmental modeling

<b>Course title</b>	Lab-and-field data acquisition and analysis for studying Hydraulic Processes
<b>Lecturer</b>	Diana De Padova
<b>Scientific Discipline Sector</b>	CEAR-01/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>Aim of this course is the introduction to the study of partial differential equations. The three main types of linear second order partial differential equations will be considered: parabolic (diffusion equation), elliptic (Laplace equation), and hyperbolic (wave equation), underling their theoretical and applied features. The course provides the basic concepts necessary to carry out measurements, process data and derive hydrodynamic and physical meanings form large data sets. The following topics are studied, combining theory and practical examples:</p> <p>Measurement definition and concept. Measurement instrumentation and sensors. Sources of error. Measurement uncertainty.</p> <p>Measurement in static and dynamic conditions.</p> <p>Instrument calibration. How to get a calibration curve from laboratory data.</p> <p>Sensitivity, accuracy and precision. Measurement range and frequency response. Instrument precision. Measurement error. Theory of errors.</p> <p>How to carry out a measurement. Nyquist theorem. Sampling duration.</p> <p>Signal analysis in time and frequency domain. FFT and IFFT.</p> <p>How to obtain a spectrum of the measured signal with FFT technique.</p> <p>Acquisition signal chain. Control and management of remote measuring stations, with sensors sampling hydrodynamic parameters.</p> <p>Acoustic and laser signal sources. Doppler effect. Measuring flow velocity with LDA and ADV sensors. Practical trials at the Coastal Engineering Laboratory – LIC of the DICATECh and analysis of acquired data.</p>

<b>Course title</b>	Mathematical models for transportation systems
<b>Lecturer</b>	Aleksandra Colovic
<b>Scientific Discipline Sector</b>	CEAR-03/B
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year/Semester</b>	First/Second
<b>Tentative Calendar</b>	13/07/2026: 10.00-13:00 16/07/2026: 09.00-13:00 20/07/2026: 10.00-13:00
<b>SUMMARY /GOAL</b>	Mathematical models of transportation systems represent, for a real or hypothetical transportation system, the demand flows, the functioning of the physical and organizational elements, the interactions between them, and their effects on the external world. Mathematical models and the methods involved in their application to real, large-scale systems are thus fundamental tools for evaluating and/or designing actions affecting the physical elements and/or organizational components of transportation systems. The goal of this course is to provide the Ph.D. students the theoretical background and knowledge necessary to analyze and manage transportation systems. The course will be focused on mathematical models that represent transportation supply systems (these models combine traffic flow theory and network flow theory models) and transportation demand/supply interactions.
<b>Syllabus</b>	Introduction to transportation systems Supply models Random Utility theory Four-step model Traffic assignment models
<b>Bibliography</b>	Cascetta, E., 2009. <i>Transportation systems</i> , Springer Optimization and Its Applications, Transportation Research
<b>Examination method</b>	Application of the obtained theoretical background for solving certain problem of your choice (e.g., small-sized example) and presenting obtained results in a Power Point presentation (maximum 10 minutes)
<b>Room</b>	On-site MaaS Control room

<b>Course title</b>	Research in Architecture and Engineering Aided by Information Models: From BIM to Digital Twin for the Built Environment
<b>Lecturer</b>	Silvana Bruno
<b>Scientific Discipline Sector</b>	CEAR-08/B
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>In architecture, engineering and construction (AEC) research, information modelling methods and technologies have been further investigated to enhance design, assessment, execution and management of the built environment. Among these methods, Building Information Modelling (BIM) research is still evolving from data collection, information integration and knowledge management for new buildings and assets. The approach has also been developed for refurbishment / restoration of historic buildings and tangible Cultural Heritage, turning it into HBIM (Heritage or Historic BIM).</p> <p>In both the research directions, BIM is recently used to create the parametric virtual twin of the real entity to support the creation of the Digital Twin Framework, able to support decisions before the project stage through simulations, and during operation and maintenance activities through monitoring and analysing performance data. This course will provide theoretical and practical reference about current and future research about and with BIM methodology and tools, underling potential research in different construction engineering domains. Fundamentals in data structure and data types will be provided aiming at interoperable pipelines with further Information Systems, according to different application domains.</p>

<b>Course title</b>	Sustainable Mobility and Shared Mobility in a Smart Cities framework: optimization models and applications
<b>Lecturer</b>	Margherita Mascia
<b>Scientific Discipline Sector</b>	CEAR-03/B
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	Shared mobility is one of the possible solutions for reducing the traffic congestion problem following the sustainable mobility perspective. It offers the potential to enhance the efficiency, competitiveness, social equity, and quality of life in large cities. The goal of this course is to provide the Ph.D. students the theoretical background and knowledge necessary to manage optimization models for solving shared mobility problems considering environmental aspects. Moreover, basic knowledge in using IBM ILOG CPLEX and MATLAB software for solving Integer Linear Programming models is carried out. The lectures will be structured into two parts. The first part of the course will be focused on the introduction to shared mobility and recent technologies applied to reach the Mobility-as-a-Service concept. Furthermore, a short introduction about optimization models, e.g., Vehicle Routing Problem, for solving transportation issues. The second part of the course will deal with exercises of Integer Linear Programming models through the usage of IBM ILOG CPLEX and MATLAB software.

<b>Course title</b>	Nuclear Techniques and Innovative Sensors for Medical Applications
<b>Lecturer</b>	Dayron Ramos Lopez
<b>Scientific Discipline Sector</b>	PHYS-01/A , PHYS-03/A– PHYS-06/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	First
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The course introduces basic concepts of nuclear physics applied in medicine, reaching advanced radiotherapies and modern tools of particle simulation studies.</p> <p>The additional goal is to provide a deep understanding of sensor technologies and contribute to the field by developing and implementing innovative dosimetry sensors. Graduates should be capable of conducting cutting-edge research, advancing the field, and addressing challenges in areas such as medical, environmental, and industrial applications of radiation. The program aims to foster critical thinking, research skills, and a strong sense of ethical responsibility in the domain of dosimetry.</p>
<b>Syllabus</b>	<ul style="list-style-type: none"><li>• Introduction to the interaction of radiation with matter and dosimetry</li><li>• Radio isotopes in medical diagnosis</li><li>• Gamma Camara, Computational tomography basics</li><li>• PET/SPECT imaging techniques</li><li>• Innovative radiation therapy with hadrons: HT and BNCT</li><li>• Monte Carlo on medical physics, Tool for Particle Simulation (TOPAS)</li><li>• Introduction to Dosimetry</li><li>• Sensor Technologies</li><li>• Radiation Detection Techniques</li><li>• Use of innovative sensors in medical radiation therapy</li></ul>
<b>Bibliography</b>	<ul style="list-style-type: none"><li>- Physics in Nuclear Medicine, 4<sup>th</sup> Edition 2012, Simon R. Cherry, James A. Sorenson, Michael E. Phelps.</li><li>- Radiation Detection and Measurements, 4<sup>th</sup> Edition 2010, Glenn F. Knoll.</li></ul>

<b>Course title</b>	Elements of digital transition in civil engineering
<b>Lecturer</b>	
<b>Scientific Discipline Sector</b>	CEAR-01/B
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The course aims to provide elements of digital transition tools in water engineering and the concept of Digital Twin and Digital Water Service. The students were introduced to advancements in data acquisition, storage and representation with the latest methodologies developed from technical-scientific research based on complex network theory, machine learning and multi-objective optimization.</p> <p>The final aim is to provide PhD students with effective and transferable products that implements efficient processes to face various technical issues. Advanced applications to Water Distribution Networks (WDNs) will be used as benchmarks, involving students in applying Digital Water Services to integrate the concept of Digital Twin, tailored for WDNs, with well-established algorithms and methodologies, to support solving WDN life-cycle management issues.</p>

<b>Course title</b>	Innovation of business models in the civil infrastructure sector
<b>Lecturer</b>	Ilaria Mancuso
<b>Scientific Discipline Sector</b>	IEGE-01/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>This module aims to provide concepts, approaches and techniques for the generation, management, analysis and innovation of business models in the civil infrastructure sector. Specifically, during the course the main reference frameworks for the definition of a business model will be presented as well as the patterns of existing business models with particular focus on the civil infrastructure sector. The innovation dynamics of business models will also be explored in depth, providing useful elements for structuring the evolution process, especially in reference to the adoption of the most recent digital technologies enabling a digital innovation path in the civil infrastructure sector. The module will include alternating theoretical lessons with practical sessions (examples, case studies and project work).</p> <p>Below is the summary structure of the module:</p> <ul style="list-style-type: none"><li>– Business models (definitions and frameworks).</li><li>– Business model patterns (with focus on the civil infrastructure sector).</li><li>– Innovation of business models and digital innovation in the sector.</li></ul>

<b>Course title</b>	Practical Course in physical modelling for coastal engineering
<b>Lecturer</b>	Matteo Gianluca Molfetta
<b>Scientific Discipline Sector</b>	CEAR-01/B
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year/Semester</b>	Second/Second
<b>Tentative Calendar</b>	12/05/2026: 10.30-14:30 14/05/2026: 10.30-14:30 19/05/2026: 10.30-14:30 21/05/2026: 10.30-14:30 26/05/2026: 10.30-14:30
<b>SUMMARY /GOAL</b>	The Practical Course in Coastal Engineering gives Ph.D. students an insight into physical experiments related to coastal engineering research. The focus is on the planning, implementation and evaluation of physical experiments in maritime laboratories on both 2d and 3d small scale models. Scaling criteria of both hydrodynamic and morpho dynamic quantities, measurement techniques, data acquisition, analysis and post processing will be the main contents of the course
<b>Syllabus</b>	<ul style="list-style-type: none"><li>– Introduction to measurement and experimental techniques in coastal engineering.</li><li>– Planning and execution of model tests - Scaling criteria.</li><li>– Acquisition and analysis of measurement data using ultrasonic and resistive wave gauges, pressure transducers, ADV, bed profiler, load cells, laser scanner, lidar, photogrammetry, etc.;</li><li>– Statistical description of the generated waves in time domain.</li><li>– Parameterization using characteristic wave parameters and analysis of sediment transport processes in scaled physical models.</li></ul>
<b>Bibliography</b>	<i>Coastal Engineering Manual (CEM 2000)</i> - US Army Corps of Engineers
<b>Examination method</b>	The exam will consist of a practical test on wave motion data acquisition and processing, to be held at the Coastal Engineering Laboratory of the Polytechnic University of Bari.
<b>Room</b>	On-site / Microsoft Teams

The lectures will be held in hybrid mode, both on site in a physical DICATECh classroom (to be defined) and via the Microsoft Teams groupOn

<b>Course title</b>	Analysis and representation techniques for architectural research
<b>Lecturer</b>	Massimo Leserri
<b>Scientific Discipline Sector</b>	CEAR-10/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The course aims to stimulate a critical attitude in the study of the city and architecture, providing to the young researcher a repertoire of analysis techniques and representation models to support research.</p> <p>The techniques of survey of the existing, laser scanner and photo-modeling, are joined to those of the nonexistent, graphic analysis and graphic reconstruction, providing the tools and methods for a research of architectures in <i>præsentia</i> that can be studied and analyzed also metrically, that those in <i>absentia</i> designed and never realized.</p> <p>The course aims to analyze and graphically return the different components of architecture and the city, and with the tools of drawing and modeling investigate the historical / evolutionary process or the ideation / composition process too. These are fundamental cognitive moments for the study of an architecture or a part of the city and at the same time to analyze the complex personality of its author.</p> <p>Practical exercises alternate with lectures encouraging young researchers to use the techniques of analysis and graphic representation, articulating and stimulating their critical skills in reading an architecture and / or the city or a portion of it.</p>

<b>Course title</b>	Historical research and study of the Ancient architecture
<b>Lecturer</b>	Antonio Labalestra
<b>Scientific Discipline Sector</b>	CEAR-11/A – ARCH-01/D
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>Ancient architecture is almost always in a state of ruin. His study, aimed at formulation of reliable hypotheses of reconstruction of the building, must be based on integrated survey methodologies that use the detailed analysis of the ancient ruined building as an essential knowledge base. They are taken into consideration therefore, besides to the observations derived from the results of the architectural survey, also any iconographic testimonies from other sources, such as vascular painting, frescoes, bas-reliefs, images on coins, etc. The building and its construction and morphological details, as well as, when present, his architectural sculpture must then be compared with others contemporary architectures, in order to include it in its historical-geographical context.</p> <p>The course therefore aims to present some completed or ongoing architectural research that can effectively illustrating the research method mentioned above. In particular, the following case studies will be addressed:</p> <ul style="list-style-type: none"><li>- The Arch of Trajan in Leptis Magna</li><li>- The reconstruction of urban planning of Kos</li><li>- The Curia in Leptis Magna</li><li>- Architectural sculpture in the anastylosis of ancient buildings</li><li>- Urban planning in Ionia and Caria between the archaism and the Hellenistic age</li><li>- Architectural and decorative models in the mausoleums of the imperial age in Libya</li><li>- The Hellenistic theatre in Mytilene</li><li>- The townscape in the figurative culture of Greek and Roman times</li><li>- The urban planning ant the agora of Byllis (Albania)</li></ul>

	- The Cistern in the agora of Byllis, analysis of the typology and of the constructive aspects.

<b>Course title</b>	The architecture of construction
<b>Lecturer</b>	Tiziano De Venuto
<b>Scientific Discipline Sector</b>	CEAR-08/C
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year/Semester</b>	Second/Second
<b>Tentative Calendar</b>	04/05/2026: 16.00-18:30 07/05/2026: 16.00-18:30 11/05/2026: 16.00-18:30 15/05/2026: 16.00-18:30 25/05/2026: 16.00-18:30 29/05/2026: 16.00-18:30 05/06/2026: 16.00-18:30 10/06/2026: 16.00-18:30
<b>SUMMARY /GOAL</b>	<p>The didactic project of the course assumes the relationship between space and the constructive forms of architecture as a problematic core, through a point of view that recognizes construction as the most powerful expressive resource for the representation of the spatial character of buildings. The thought on the structure, therefore, seems to be problematized in a dialectical tension between the disciplines of architecture and engineering, whose common language is that of matter and its possible formal definitions.</p> <p>The purpose of the course is to develop a particular approach to research on architectural design that is able to recognize, problematically, the relationship between space and the design of its structural systems, from type to construction. By declining the constructive paradigms of history and their cultural areas of reference, it is possible to identify some interpretative lines that feed the most recent structural experiments on matter, between the definition of its possible forms and the search for their own figurative identity. Just think of the research on the forms of reinforced concrete carried out in Switzerland since the beginning of the twentieth century, where the technical forms of the structure (also in the construction of bridges and infrastructure works) exceed their aesthetic autonomy, interpreting the relationship with the landscape in which they are located.</p>

	Between Architecture and the Art of structures.
<b>Syllabus</b>	<ul style="list-style-type: none"><li>• Character and Construction. The Bridge as the Invention of a New Place;</li><li>• Rooting in the earth: The desire to contemplate the horizon. <b>Course title</b>	The architecture of structural forms
<b>Lecturer</b>	
<b>Scientific Discipline Sector</b>	CEAR-09/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The didactic project of the course assumes the relationship between space and the constructive forms of architecture as a problematic core, through a point of view that recognizes construction as the most powerful expressive resource for the representation of the spatial character of buildings. The thought on the structure, therefore, seems to be problematized in a dialectical tension between the disciplines of architecture and engineering, whose common language is that of matter and its possible formal definitions.</p> <p>The purpose of the course is to develop a particular approach to research on architectural design that is able to recognize, problematically, the relationship between space and the design of its structural systems, from type to construction. By declining the constructive paradigms of history and their cultural areas of reference, it is possible to identify some interpretative lines that feed the most recent structural experiments on matter, between the definition of its possible forms and the search for their own figurative identity. Just think of the research on the forms of reinforced concrete carried out in Switzerland since the beginning of the twentieth century, where the technical forms of the structure (also in the construction of bridges and infrastructure works) exceed their aesthetic autonomy, interpreting the relationship with the landscape in which they are located. Between Architecture and the Art of structures</p>

CTI

<b>Course title</b>	The post-growth paradigm in planning research
<b>Lecturer</b>	Mariella Annese
<b>Scientific Discipline Sector</b>	CEAR-12/B
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The educational objective of the course The post-growth paradigm in planning research is to offer PhD students the tools to understand the complexity of the contemporary world and acquire the ability to develop an autonomous and conscious thought with respect to the problematic issues and challenges that it arises. The course therefore aims to deepen the main phenomenologies of the post-growth paradigm in the city and in the territory, and at the same time discuss the lines of research that the disciplines of the territory, and in particular urban planning, have started in recent decades. There will be frontal lectures and exercises, closely integrated, that articulate the course in two parts. The first part of the course will be dedicated to thematic lectures, in which the themes of the post-growth paradigm, its causes and material manifestations will be deepened; moreover, the paths of the contemporary urban research will be outlined, in the directions of a renewed relationship with the existing, of the valorization of the territorial heritage, of the integration and contamination with the disciplines that deal with the themes of sustainability and climate change. The second part will be dedicated to exercises to be developed with reference to specific case studies representative of current research. These will take place in the form of interlocutions that, through comparison, will help doctoral students to acquire an autonomous ability to apply the knowledge acquired through analytical and critical tools useful to interpret the different theoretical positions and evaluate the operational consequences. The attribution of training credits will take place through an interview, aimed at verifying the acquisition of knowledge and skills by the doctoral student.</p>

	In the evaluation will also take into account the participation in training activities carried out.

## DAUSY

<b>Course title</b>	Control and Security of Cyber Physical Systems
<b>Lecturer</b>	Ruotian Liu
<b>Scientific Discipline Sector</b>	IINF-04/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	The aim of the course is to show the importance of control and security in Cyber Physical Systems (CPSs). CPSs are systems where a decision making(cyber/control)component is tightly integrated with a physical system(with sensing/actuation) to enable real-time monitoring and control. Therefore, control and security are crucial issues for commissioning these systems and for improving competitiveness of companies. In this context, the study of opacity is a fundamental notion to determine if an industrial "secret" can be discovered by a malicious observer (intruder).

<b>Course title</b>	Data-driven fault diagnosis and fault prognosis
<b>Lecturer</b>	Riccardo Felicetti
<b>Scientific Discipline Sector</b>	IINF-04/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year/Semester</b>	Second/Second
<b>Tentative Calendar</b>	05/05/2026: 10.30-13:00 07/05/2026: 10.30-13:00 12/05/2026: 10.30-13:00 14/05/2026: 10.30-13:00
<b>SUMMARY /GOAL</b>	<p>This module aims at providing PhD students with the main concepts of data-driven fault diagnosis and fault prognosis which are at the base of modern condition-based and predictive maintenance.</p> <p>During the module, the students will learn how to apply a data-driven workflow to solve real case studies and to adapt it to the specific cases of fault diagnosis and fault prognosis. The workflow will include data processing, feature extraction and model training, with some insights on deployment complexity; problem resolution will also be implemented by using a common engineering software (MATLAB).</p> <p>The final goal is to provide PhD students with the necessary background to process sensors data and use them to monitor the condition of a physical system, classify possible undesired behaviours and eventually estimate the remaining useful life of specific components.</p> <p>Each lesson consists in lectures, numerical examples and analysis of case studies.</p>
<b>Syllabus</b>	<ul style="list-style-type: none"> <li>-Motivating examples: from industry to robotic applications.</li> <li>-Nomenclature: fault, maintenance and supervision.</li> <li>-Reliability and safety.</li> <li>-Limit checking, trend checking and hypothesis testing.</li> <li>-Data types and data normalization.</li> <li>-Filtering (signal processing).</li> <li>-Signal features in the time and frequency domain.</li> <li>-Features selection and dimensionality reduction.</li> <li>-Fault diagnosis: features extraction and classification.</li> <li>-Bias-variance trade-off.</li> <li>-Overfitting and cross validation.</li> </ul>

	<ul style="list-style-type: none"><li>-Loss functions and performance indicators.</li><li>-Hyperparameters optimization.</li><li>-Fault prognosis: condition indicators and remaining useful life estimation.</li><li>-Data-driven fault diagnosis and fault prognosis workflows.</li><li>-MATLAB Predictive Maintenance Toolbox.</li><li>-Case studies and benchmarks.</li></ul>

## DAUSY

<b>Course title</b>	Distributed/Decentralized Control and Optimization of Large-Scale Systems
<b>Lecturer</b>	Raffaele Carli
<b>Scientific Discipline Sector</b>	IINF-04/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	This course aims at providing PhD students with modeling and methodological tools for formulating and solving large-scale optimization problems with a focus on the use of duality theory. During the course several optimization problems will be formalized, particularly referred to relevant issues within management and industrial engineering. Problem definition and resolution will be also implemented in simulation and engineering software (Matlab). The final goal is to provide PhD students with the necessary background for starting research in the field of duality-based decentralized and distributed optimization techniques to be applied to large-scale systems. Each lesson consists in lectures, numerical examples, simulation and analysis of case studies.

<b>Course title</b>	Human autonomous system interaction
<b>Lecturer</b>	Sabrina Iarlori
<b>Scientific Discipline Sector</b>	IINF-04/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The course aims at providing PhD students with the main concepts of the well-known technology for improving human-autonomy interaction with a special focus on autonomous systems. It is especially focused on technology and case studies relevant to complex, applied environments in which people interact with autonomous systems regularly, particularly in the context of ambient assisted living. The course focuses on approaches that include task inputs from humans: how to model humans and their tasks and at what level of details. Moreover, the human in-the loop approach will be introduced as a new scenario to facilitate the goal achievement, to reduce the anomalies and the unexpected responses from the system or inappropriate responses by the human to enhance human safety. New human-system engineering techniques are needed to ensure autonomous systems will be smoothly and readily adopted into society. Autonomous systems that work together in the environment should integrate the connections and interactions between them, over networks, with the physical environment, and with humans must be assured, resilient, productive, and fair in the autonomous future. Autonomous systems should be analysed including concept, context, requirements, design, integration, operationalization, validation, testing and evaluation. During the course, the students will learn how the human-autonomous system interaction is achieved and how it is articulated. The workflow will include data processing, feature extraction and model training for human-robot interaction tasks, with some insights on deployment complexity; problem resolution will also be proposed by using a common engineering software (MATLAB), and the ROS (Robot</p>

	Operating System). Each lesson consists in lectures, numerical examples and analysis of case studies.

<b>Course title</b>	Linear and nonlinear Kalman filtering: theory and applications
<b>Lecturer</b>	Marco Todescato
<b>Scientific Discipline Sector</b>	IINF-04/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year/Semester</b>	Second/First
<b>Tentative Calendar</b>	27/04/2026: 10.30-12:30 04/05/2026: 09.30-12:30 11/05/2026: 09.30-12:30 18/05/2026: 09.30-13:30 25/05/2026: 09.30-13:30 01/06/2026: 09.30-13:30
<b>SUMMARY /GOAL</b>	This course aims to provide both theoretical and practical tools to tackle estimation problems encountered in several areas of engineering and science. In particular, it is shown how to formulate such estimation problems as instances of a general dynamical system state estimation problem and how to derive the mathematical solution of the latter problem. Then it is shown that, for a linear Gaussian system, such a solution yields the well-known Kalman filter. Further, approximate techniques (e.g. extended and unscented Kalman filters, particle filter, etc.) are presented for the case of nonlinear and/or non-Gaussian systems, for which an exact closed-form solution cannot be found. To conclude the theoretical part, theoretical limitations (i.e. the Cramer-Rao lower bound) on the quality of estimation are discussed. In the final part of the course, we illustrate some applications of linear/nonlinear Kalman filtering (e.g., tracking, robotic navigation, environmental data assimilation).
<b>Syllabus</b>	Refer to summary/goal.
<b>Bibliography</b>	Scientific papers in addition to slides and supporting material from lecturer.
<b>Examination method</b>	Software project work plus presentation of the results.

## DAUSY

<b>Course title</b>	Non-integer order systems and controllers
<b>Lecturer</b>	Guido Maione
<b>Scientific Discipline Sector</b>	IINF-04/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year/Semester</b>	Second/First
<b>Tentative Calendar</b>	09/02/2026: 15:00-17:00 10/02/2026: 15:00-17:00 11/02/2026: 15:00-17:00 12/02/2026: 15:00-17:00 13/02/2026: 15:00-17:00
<b>SUMMARY /GOAL</b>	The course concerns non-integer-order systems. These systems can propose engineering solutions to modeling and control problems that often improve those based on integer-order calculus. Basic tools of fractional calculus are introduced, and some methods and models are described for different engineering fields. Models for practical applications are proposed. Moreover, approaches to design and realize non-integer-order (fractional-order) controllers are described. These controllers show higher flexibility, increased robustness, and ability to obtain a better trade-off between stability and dynamic performance with respect to widespread PID controllers. As case-studies, the course uses applications in automotive and mechatronic systems.
<b>Syllabus</b>	Fractional calculus, non-integer-order systems and non-integer-order controllers. Design of non-integer-order controllers and case studies. Realization by approximation of non-integer-order controllers. Case studies, exercises, simulation of non-integer-order controllers, discussion. Application: control of an automotive system.

<b>Course title</b>	Variable Structure Control
<b>Lecturer</b>	Elio Usai
<b>Scientific Discipline Sector</b>	IINF-04/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	Variable Structure Control (VSC) is a control technique who force a dynamical system to behave as a Variable Structure System (VSS) whose characteristics satisfy the required performance, in spite of a class of uncertainties in the system dynamics and external disturbances. In particular the system is forced to reach and remain constrained onto a properly chosen surface of the state space such that the movement on such a surface, i.e., the Sliding Mode (SM), is invariant and corresponds to specifications. The lectures will present the general theoretic and applicative framework of VSC with SMs, presenting it in the more general vision of the control systems. Some of the mathematical tools to analyze and design a VSC with SM will be presented and discussed, also by means of simple examples. The limits of the resulting switching control, the tools to analyze the approximate behavior and the approaches to mitigate the so-called chattering phenomenon will be presented and discussed. Finally, some applications of VSC to real systems and to observer design will be presented.

<b>Course title</b>	Green Photonics for a sustainable economy
<b>Lecturer</b>	Muhammad Khalid
<b>Scientific Discipline Sector</b>	IINF-02/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year/Semester</b>	Second/First
<b>Tentative Calendar</b>	19/01/2026: 10.00-12:30 22/01/2026: 10.00-12:30 26/01/2026: 10.00-12:30 29/01/2026: 10.00-12:30
<b>SUMMARY /GOAL</b>	The course aims at introducing some fundamental photonic technologies for sustainable energy generation, for energy saving, and for environmental monitoring. The topics of the course will be mainly introduced through hands-on computer simulations That will deal with green photonic devices such as solar cells, sensors, and new photonic technologies for communication.
<b>Syllabus</b>	Introduction to green photonics. Introduction to numerical simulation of photonic devices. Sustainable energy generation: nanostructures for photovoltaics. Photonic devices for reduced energy consumption. Photonic sensors for environmental monitoring.
<b>Bibliography</b>	Scientific papers, slides and support material from lecturer.
<b>Examination method</b>	Oral presentation or project work
<b>Room</b>	Microsoft Teams <a href="#">Green photonics for a sustainable economy   Microsoft Teams   General</a>

<b>Course title</b>	Micromagnetic modeling
<b>Lecturer</b>	Davi Rohe Salomon Da Rosa Rodrigues
<b>Scientific Discipline Sector</b>	IIET-01/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>This course provides an introduction to the micromagnetic modeling, from an interdisciplinary perspective focused on electrical engineering and physics, and gives the key-concepts for the following course on Spintronics Applications. Micromagnetic modeling is a major theoretical framework to analyze magnetic materials at the micrometer scale and below.</p> <p>Students will be introduced to basic concepts of nanomagnetism and micromagnetics. They will learn how the competing micromagnetic energies affect the magnetic state and the equations which govern the dynamics of the magnetization. They will also learn the fundamentals of the numerical implementation of micromagnetism and perform numerical simulations by means of a micromagnetic solver, using MATLAB for post-processing the output data.</p> <p>Each lesson shall consist in a lecture with numerical examples.</p>

## DRIG

<b>Course title</b>	From qualitative to quantitative methods in business research
<b>Lecturer</b>	Daniele Sandro Rotolo
<b>Scientific Discipline Sector</b>	IEGE-01/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The aim of the course is to provide PhD students with a set of building blocks for conducting, at the academic level, both quantitative and qualitative research in the areas of management, economics, and policy. As quantitative research, the course addresses three main issues of qualitative research. First, the course provides theoretical insights into different quantitative research methodologies and designs. Second, the course introduces PhD students to various methodologies for gathering data, observations, and evidence and for organising them in ways that can be used for quantitative analysis. Third, the course introduces PhD students to various quantitative methodologies – from regression analysis to text mining – to support PhD students in the development of practical skills as well as critical thinking for interpretation purposes. As to the qualitative research, PhD students will be introduced to the basic ideas behind the qualitative research in social science. Students will learn about data collection, description, analysis and interpretation in qualitative research. Qualitative research often involves an iterative process. The course will focus on the ingredients required for this process: data collection and analysis.</p>

<b>Course title</b>	Human-based Smart Manufacturing Systems
<b>Lecturer</b>	Andrea Lucchese
<b>Scientific Discipline Sector</b>	IIND-05/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year/Semester</b>	Second/First
<b>Tentative Calendar</b>	08/01/26 h. 09:00-13:00 09/01/26 h. 09:00-13:00 23/01/26 h. 09:00-13:00 05/02/26 h. 09:00-13:00 06/02/26 h. 09:00-13:00
<b>SUMMARY /GOAL</b>	The course aims to provide students with a deep understanding of the principles and applications of Industry 5.0, emphasizing the integration between human intelligence and smart technologies within modern manufacturing systems. It focuses on the transition from Industry 4.0's automation and digitalization paradigm to a human-centric, resilient, and sustainable production model, enhancing both competitiveness and social value.
<b>Syllabus</b>	<b>Rationale</b> The fifth industrial revolution, known as Industry 5.0 (I5.0), encompasses a vision for a human-centred, innovative, resilient, and competitive industry. I4.0 moved the focus from a traditional product-driven (mass) industrial production towards a "demand-driven" market that requires the fully-integrated systems able to adapt, in real-time, the production system to the demand change. The I5.0 approach re-introduces the human-centred dimension as the key resource of a smart production systems adopting I4.0 technologies. In the transition from traditional to new production systems, two critical elements arise: the companies' "readiness degree", that is, the assessment of the potential benefits from the adoption of I4.0 technologies and the "human component". With the aim of successfully implementing ICT technologies allowing 'thing', 'services' and 'human' to be continuously remotely connected by i-cloud centralized systems, a reliable evaluation of both the potential increasing of the competitiveness degree and a reliable description of

	<p>the behaviour and of the knowledge and skills of the human component in the new work environment are required.</p> <p>Program:</p> <ul style="list-style-type: none"><li>• <b>08 January 2026</b> Human Centric Impact of Assistive Technologies in Production and Logistics Systems</li><li>• <b>09 January 2026</b> TPM &amp; Industry 5.0 in FMCG (Fast-Moving Consumer Goods) Manufacturing</li><li>• <b>23 January 2026</b> Industry 4.0, Internet of Things and Lifecycle Management. Digital Integration of the Factory: towards the I5.0 Paradigm</li><li>• <b>05 February 2026</b> Towards a holistic approach to measuring operators' well-being within the Industry 5.0 paradigm: Tools and methods</li><li>• <b>06 February 2026</b> Human centric collaborative workplace: the human robot interaction system perspective</li></ul>
<b>Bibliography</b>	Scientific papers, slides and support material from lecturer.
<b>Examination method</b>	The final assessment consists of a multiple-choice written test (graded in 30/30) evaluating students' comprehension of Industry 5.0 concepts, human-centred production systems, and smart manufacturing technologies.

<b>Course title</b>	Adjoint methods for gradient-based optimisation and control of energy systems
<b>Lecturer</b>	
<b>Scientific Discipline Sector</b>	IIND-06/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>The course then aims at providing PhD students with the fundamental knowledge and the main techniques for the optimization and control of energy systems using adjoint methods. Adjoint methods are powerful mathematical tools that play a crucial role in sensitivity analysis, gradient computation, and optimization of complex systems. In this course, we will focus on their application in energy systems, covering both theoretical foundations and practical implementation. The student will understand the fundamentals of adjoint methods and their relevance to optimization and control. He will be able to apply adjoint methods to:</p> <p>(a) perform sensitivity analyses on linear and nonlinear partial differential equation; (b) explore optimization techniques using adjoint methods for energy system design and control; (c) gain hands-on experience in implementing adjoint methods through practical examples and exercises; (d) investigate real-world applications of adjoint methods in propulsion systems, power systems, and other energy domains.</p> <p><b>Syllabus:</b></p> <ol style="list-style-type: none"> <li>1. ## DRIME

<b>Course title</b>	Design of User Experience to exploit Extended Reality for the enhancement of research activities
<b>Lecturer</b>	Michele Gattullo
<b>Scientific Discipline Sector</b>	IIND-03/B
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	The course aims to provide PhD students with the fundamental knowledge of all these technologies, presenting both opportunities and threats. The course will start with the presentation of success stories about the use of XR in industrial research. Then, during the course, the main theoretical and methodological issues in the design of an XR application will be covered. Great relevance will be given to the practice: PhD students will be provided with tools to design User Experiences to exploit XR for the enhancement of their research activities. They will also be introduced to the use of the software Unity, a game engine commonly used to develop XR scenes. Finally, the course will teach how to evaluate the XR applications designed and developed.

<b>SUMMARY /GOAL</b>	This course provides foundational knowledge for simulating manufacturing processes such as fusion welding, solid-state welding, deformation, or additive manufacturing. The classes are divided into two parts: - Theory: an introduction to manufacturing processes, key challenges, and basic principles of Finite Element Modeling (FEM). - Practice: hands-on simulation exercises. Simulations will be carried out using the specialized Finite Element Analysis (FEA) software Simufact MSC. By the end of the course, students will be able to conduct virtual tests, design and optimize manufacturing processes.
<b>Syllabus</b>	
<b>Bibliography</b>	
<b>Examination method</b>	An individual simulation project focused on a manufacturing process chosen by the student

## DRISA

<b>Course title</b>	High-energy particle physics instruments and methods for space environment
<b>Lecturer</b>	Roberta Pillera
<b>Scientific Discipline Sector</b>	PHYS-01/A , PHYS-03/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	The course aims to provide an overview of basic principles of particle physics and of the main detectors used for space applications. Moreover, the explanation of the environmental verification strategy aims to give the students a complete overview of the steps needed to take a detector from construction to a correct on-orbit operation.
<b>Syllabus</b>	
<b>Bibliography</b>	
<b>Examination method</b>	
<b>Room</b>	On-site / Microsoft Teams

## DRISA

<b>Course title</b>	Hydraulics for Aircraft
<b>Lecturer</b>	
<b>Scientific Discipline Sector</b>	IIND-06/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	The course will enable PhD students to gain knowledge about conventional and novel hydraulic systems employed in aircraft for fuel metering and for flight control. In addition, students will master Simulink simulations of these systems. The acquired knowledge can be transferred to the study and simulation of hydraulic components and systems employed in industry and in the transportation sector.
<b>Syllabus</b>	
<b>Bibliography</b>	
<b>Examination method</b>	
<b>Room</b>	On-site / Microsoft Teams

**DRISA**

<b>Course title</b>	Hypersonic aerothermodynamics modelling and simulation
<b>Lecturer</b>	Francesco Bonelli
<b>Scientific Discipline Sector</b>	IIND-01/F
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year/Semester</b>	Second/Second
<b>Tentative Calendar</b>	05/05/2026: 15.30-18:00 12/05/2026: 15.30-18:00 19/05/2026: 15.30-18:00 26/05/2026: 15.30-18:00 04/06/2026: 15.30-18:00 09/06/2026: 15.30-18:00 16/06/2026: 15.30-18:00 23/06/2026: 15.30-18:00
<b>SUMMARY /GOAL</b>	The aim of the course is to provide fundamentals of the physics, chemistry, and gas dynamics of high-temperature gases in the context of hypersonic flows. The course provides an introduction to gas dynamics of high temperature gases with a specific emphasis to thermochemical non-equilibrium and gas surface interactions with examples of accurate numerical simulations.
<b>Syllabus</b>	<p><b>(4h) Introduction to hypersonic flows and short review of basic gas dynamics:</b> definition of hypersonic flow; Knudsen number, flow regimes and governing equations; quasi-one-dimensional flow, area Mach number relation, normal shock waves, oblique shock, and expansion waves.</p> <p><b>(8h) Properties of high-temperature gases:</b> microscopic description of gases, Boltzmann distribution, thermal and chemical non-equilibrium: classical multi-temperature model and introduction to State-to-State approaches.</p> <p><b>(3h) Gas dynamics of high-temperature flows:</b> quasi-one-dimensional flow, normal shock waves, speed of sound, oblique shock and expansion waves.</p> <p><b>(3h) Gas surface interactions:</b> catalytic and ablation phenomena.</p> <p><b>(2h) Overview of Computational Fluid Dynamics approaches for hypersonic flows and numerical examples.</b></p>

<b>Examination method</b>	The exam will take place through an interview on a specific topic as-signed to the student
<b>Room</b>	On-site: aula riunioni al secondo piano della sezione meccanica del DMMM

## DRISA

<b>Course title</b>	Identification and propagation of optical photons in different media
<b>Lecturer</b>	Francesca Romana Pantaleo
<b>Scientific Discipline Sector</b>	PHYS-01/A , PHYS-03/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	The course aims to provide the student with advanced knowledge of radiation measurements and detection techniques, from classic scintillation detectors to Silicon Photomultiplier devices. Scintillator materials are widely used in particle physics for ion identification and energy measurements. Next-generation space missions will employ plastic scintillator detectors (PSDs) equipped with the new Silicon Photomultipliers (SiPMs) technology to read out the scintillator light emission. Scintillator based detectors are also widely used for radiation monitoring for environmental or industrial purposes. The course requires an elementary background in radiation measurements, radiation-matter interactions and basic electronics.
<b>Syllabus</b>	
<b>Bibliography</b>	
<b>Examination method</b>

<b>Course title</b>	Characterization and modeling of light alloys
<b>Lecturer</b>	Angela Cusanno
<b>Scientific Discipline Sector</b>	IIND-04/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year/Semester</b>	Second/Second
<b>Tentative Calendar</b>	16/06/2026: 09.00-13:00 17/06/2026: 09.00-13:00 18/06/2026: 09.00-13:00 24/06/2026: 09.00-13:00 25/06/2026: 09.00-13:00
<b>SUMMARY /GOAL</b>	This course will be focused on the main experimental methodologies for the technological characterization of light alloys for automotive/aerospace/biomedical applications.
<b>Syllabus</b>	<u>1. Introduction to sheet metal forming processes to produce lightweight components:</u> overview of lightweight alloys, conventional and innovative sheet metal forming processes <u>2. Methodologies for characterization:</u> mechanical characterization methods for cold and warm/hot forming processes <u>3. Evaluation of light alloys forming limits:</u> Nakajima and Marciak tests, bulge tests <u>4. Hands-on activities:</u> Performing mechanical tests studied during the course on a light alloy, obtaining the mechanical properties of the alloy from experimental data
<b>Bibliography</b>	I. Polmear, D. StJohn, J. Nie, M. Qian, Light Alloys (Fifth Edition), Butterworth-Heinemann, 2017, ISBN 9780080994314 Z. Marciak, J.L. Duncan, S.J. Hu, Mechanics of Sheet Metal Forming (Second Edition), Butterworth-Heinemann, 2002, ISBN 9780750653008
<b>Examination method</b>	Performing one of the experimental mechanical tests studied, along with general questions covering the syllabus
<b>Room</b>	On-site Laboratorio di Advanced Forming & Manufacturing, Sede Japigia DMMM

## DRISS

<b>Course title</b>	Dynamic identification and structural monitoring: fundamentals and applications to wind turbines Modulo A (part one of two)
<b>Lecturer</b>	
<b>Scientific Discipline Sector</b>	CEAR-06/A – CEAR-07/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1 (Modulo A: 1 CFU CEAR-06/A + Modulo B: 1 CFU CEAR-07/A)
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	This course concerns experimental investigations of the structural response of wind turbines, in order to calibrate models for structural analysis under dynamic loads, like wind and seismic actions, and to investigate the structural health of those structures. Applicative issues will be introduced by theoretical and experimental fundamentals.
<b>Syllabus</b>	
<b>Bibliography</b>	
<b>Examination method</b>

## DRISS

<b>Course title</b>	Numerical and heat transfer challenges in Thermal Energy storage
<b>Lecturer</b>	Aminhossein Jahanbin
<b>Scientific Discipline Sector</b>	IIND-07/A – IIND-06/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2 (Modulo A: 1 ING-IND08 + Modulo B: 1 IIND-07/B )
<b>Year/Semester</b>	Second/First
<b>Tentative Calendar</b>	<p>23/04/2026: 15:00 – 17:00          28/04/2026: 14:00 – 17:00          30/04/2026: 14:00 – 17:00          04/05/2026: 14:00 – 17:00          07/05/2026: 14:00 – 17:00          11/05/2026: 14:00 – 17:00          13/05/2026: 14:00 – 17:00</p>
<b>SUMMARY /GOAL</b>	<p>Decarbonization is a crucial step towards a sustainable future, and renewable energy plays a vital role in enabling this transition. However, the intermittency of sources such as wind and solar energy necessitates the use of efficient energy storage systems.</p> <p>This course introduces various energy storage technologies and examines the role of thermal energy storage within the broader energy storage landscape. Different types of thermal energy storage systems are analyzed in detail, with emphasis on heat transfer challenges, efficiency considerations, and dynamics during charging and discharging processes. Advanced numerical modelling approaches are presented and applied through research-oriented case studies, using computational tools for system-level analysis and optimization.</p>

## DRSATE

<b>Course title</b>	Advanced Probabilistic Methods For The Reliability Analysis In Structural Engineering Problems
<b>Lecturer</b>	Andrea Nettis
<b>Scientific Discipline Sector</b>	CEAR-07/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>Introduction of elements of probability theory applied to structural and earthquake engineering: In the first part, basic elements and references about the common procedures adopted in the structural engineering are provided, accounting, in particular, the case of seismic actions. According to the recent scientific literature, the course will provide an overview about seismic demand quantification, conceptual design, mechanical and geometrical parameters configuration of the buildings, numerical modelling through finite element approaches, linear and nonlinear analyses. Within this framework, the discussion will focus on the basic concepts of probability theory applied to structural engineering, starting from the definition of random variables, statistics and sampling, regression analyses, appropriateness of fit tests, estimation of distribution parameters, testing of hypotheses and related significance. The probabilistic approach of Performance Based Earthquake Engineering (PBEE): In this part, the main limits of deterministic approaches, as commonly used by practitioners, will be highlighted, and the approach of PBEE will be formally presented. Within this framework, all aspects covered by the PBEE will be faced, accounting for the probabilistic study of seismic demand (through the definition of the probabilistic seismic hazard analysis), structural analysis (through the definition of modelling and analysis methods, such as Incremental Dynamic Analysis - IDA, Multi Stripes Analysis and cloud analysis), damage analysis (through the definition of the fragility curves by using articulated and simplified tools) and loss analysis (through the definition of the losses curves by using articulated and simplified tools) (8 hours). Practical ex-</p>

	amples of PBEE and applications in different fields of civil engineering: Based on the previous concepts, some applications of PBEE to the analysis of Reinforced Concrete (RC) buildings will be shown, with a specific reference to the most useful numerical tools presently available (from the simplest to the most sophisticated).

<b>Course title</b>	Laser scanning for architectural surveying. Techniques and applications
<b>Lecturer</b>	Anna Christiana Maiorano
<b>Scientific Discipline Sector</b>	CEAR-10/A
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>This course provides a comprehensive overview of modern architectural surveying techniques, with emphasis on laser scanning and point cloud management. The goal is to transfer practical skills and knowledge applicable to real projects in the field of architectural heritage.</p> <p>Initially, the lecture covers the fundamentals of architectural surveying, comparing traditional methods with digital advances. Then, laser scanning, details of LiDAR technology, photogrammetry, and various applications in engineering, architecture, cultural heritage, reverse engineering, and public safety are explored. The different types of laser scanners and their principles of operation, particularly phase-shift scanners, are examined.</p> <p>The course also delves into point clouds, discussing their basic concepts, creation with laser equipment, and alignment using Autodesk Recap software. Data processing techniques such as filtering, decimation and AI segmentation are covered.</p> <p>The program concludes with an interactive final project in which participants plan and conduct a laser survey, acquire and process data, and extract architectural elements. This hands-on component reinforces the practical application of the skills learned.</p>

<b>Course title</b>	Life Cycle Assessment for buildings
<b>Lecturer</b>	Carmine Cavalliere
<b>Scientific Discipline Sector</b>	CEAR-08/B
<b>Hours of instruction</b>	10
<b>CFU</b>	1
<b>Year/Semester</b>	Second/Second
<b>Tentative Calendar</b>	07/05/2026: 16.30-19:00 14/05/2026: 16.30-19:00 21/05/2026: 16.30-19:00 28/05/2026: 16.30-19:00
<b>SUMMARY /GOAL</b>	The aim of the course is to provide students with the knowledge of understanding the impact of the construction sector on the environment, the need for building sustainability, and the regulations driving them. Then the students will learn about the core concepts of LCA, including building life-cycle stages and environmental impact assessment. Finally, the third part of the course will provide students with a hands-on experience of modelling techniques and tools to simulate a LCA of a case study building. The assessment will be based on the modelling of a selected case study and on the analysis of the effects of different adaptation technologies.

## DRSATE

<b>Course title</b>	Soil-atmosphere interaction and slope stability: processes and numerical modelling
<b>Lecturer</b>	Pasquale Perrini
<b>Scientific Discipline Sector</b>	CEAR-01/B e CEAR-05/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>Recently the scientific literature has highlighted that climatic factors such as rainfall rate, net solar radiation, relative humidity, wind speed and air temperature determine a set of coupled phenomena, controlling both the skeleton of the soil and the pore fluids in the slope. Such phenomena, on the whole referred to as the 'soil-atmosphere' interaction, can differ in their nature (thermodynamic, hydraulic, mechanical and chemical) and strongly impact the balances of both the liquid and gas masses in the soil pores and the energy balance of the system. The corresponding transient seepage generates – from the ground surface to depth in the slope – variations of the effective stresses and the available shear strengths over time, which in turn impact slope stability. On the whole, the soil-atmosphere interaction at the slope top boundary, together with the processes that it determines in the slope at any depth, represent the 'slope-atmosphere' interaction.</p> <p>Multiple examples of weather-induced deep landslide mechanisms can be found in the Southern Apennines (Italy), which represents a pilot areas where the scientific research is still ongoing.</p> <p>This course will deals with transport processes at the interface between atmosphere and the soil, focussing on the exchange of energy and water between the soil and the lower part of the atmosphere. In particular, different numerical strategies, with different level of coupling, to solve the thermal, hydraulic, and mechanical processes within the soil-vegetation-atmosphere interaction will be presented to simulate and predict water and energy fluxes. Particular reference will be made to risk mitigation, with also the aim to check if such modelling strategies may be of use to design an</p>

	early warning system to reduce the risk related to landsliding and / or flooding.

## DRSATE

<b>Course title</b>	Sustainable Technologies for Circular Economy in Waste Management
<b>Lecturer</b>	
<b>Scientific Discipline Sector</b>	IMAT-01/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>Today's linear economic model (take-make-dispose) is wasteful and unsustainable. In a circular economy, the maximum value is extracted from resources in use, then products and materials are recovered and regenerated at the end of each service life. The transition from a linear economy to a circular economy is currently one of the biggest challenges in the field of waste management.</p> <p>In this perspective, the aim of this course is to develop scientific and technical aspects on the closing the loop of both urban and industrial waste. The goal is to ensure PhD students obtain a solid background in environmental technologies, with competencies for designing and tailoring new waste management systems, and with a specific view to the sustainability of processes and technologies.</p> <p>The course is developed on principles of Circular Economy and Sustainable Development, on circularity as a tool for saving non-renewable raw materials and reducing the waste production. In particular, the lessons discuss basic scientific principles and recent technological advances in current strategies for resource recovery from waste (for example: recycling of dry waste and composting of organic waste). Also, the course presents solutions to pressing problems associated with waste management and treatment, as well as the health impacts created by improper waste disposal and pollution.</p> <p>The major topics covered by the course are: 1) circular economy and sustainability: basics and application; 2) closing the loop: the circularity as a tool for saving raw material and natural resources</p>

	and to reduce waste production; 3) industrial symbiosis and urban mining definition; 4) recovery and recycling of industrial and urban waste; 5) innovative and sustainable technologies: pre-treatment and selection, mechanical-biological treatment, energy recovery, disposal in landfills; 6) use of secondary raw materials.

<b>Course title</b>	Energy storage
<b>Lecturer</b>	
<b>Scientific Discipline Sector</b>	IIND-06/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	The course addresses the topic of energy storage with a multidisciplinary approach, analyzing the differences between thermal and electrical storage from a global perspective
<b>Syllabus</b>	This course examines different energy storage technologies, empowering the reader to make informed decisions on which system is best suited for their specific needs. Decarbonization is a crucial step towards a sustainable future, and renewable energy plays a vital role in making this transition possible. However, the intermittency of some sources such as wind and solar energy requires the use of energy storage systems. The course contains a detailed study of the fundamental principles of energy storage operation, a mathematical model for real-time state-of-charge analysis, and a technical analysis of the latest research trends, providing a comprehensive guide to energy storage systems. From battery storage systems to hydrogen storage systems, this course provides the tools to effectively manage energy and ensure that excess energy is utilized during times of deficit and signposts the likely future development and lines of research enquiry for each technology discussed.

<b>Course title</b>	Microwave Photonics for Smart Systems
<b>Lecturer</b>	Giuseppe Brunetti
<b>Scientific Discipline Sector</b>	IINF-01/A
<b>Hours of instruction</b>	20
<b>CFU</b>	2
<b>Year</b>	Second
<b>Tentative Calendar</b>	
<b>SUMMARY /GOAL</b>	<p>Microwave photonics is an important interdisciplinary field that, among a host of other benefits, enables engineers to implement new functions in microwave systems. From an educational perspective, the fields of microwave engineering and photonics are often taught in separate courses. This course aims to provide both a theoretical and practical introduction to microwave photonics devices and applications.</p> <p>The first part is on microwave photonics principles and technologies, with a focus on applications and future developments.</p> <p>The second part is a laboratory and aims to prepare students for the final project. It will be shown how to design a simple component, following all the steps from the choice of technological platform to software simulations.</p>
<b>Syllabus</b>	<p>Opening with an overview to the subject, this course covers direct modulation, photonic oscillators for THz signal generation, and terahertz sources. It takes a unique application-focused approach and describes:</p> <ul style="list-style-type: none"> <li>• Advantages with respect to standard RF technologies;</li> <li>• Basic building blocks;</li> <li>• Design criteria;</li> <li>• Microwave photonic signal processing for Space applications;</li> </ul> <p>Biomedical applications.</p>
<b>Bibliography</b>	Slides provided during the lessons
<b>Examination method</b>	Final project
