4. All foreign language (i.e. non-English) titles are translated into English and all references, whether as footnotes or provided in a bibliography, are processed. The SCI originally consisted of three separate but related indexes. These are the Citation Index, the Source Index and the Permutern Subject Index. Since 1976 these three indexes have been augmented with a fourth: the Journal Citation Reports (JCR).

4. The source items citing a particular reference are arranged alphabetically by source author immediately under each reference line. The source item line contains the citing author's name, the name of the publication in which the citing item appeared and volume, page and the publication year. There is also a code indicating whether the citing item was an article, abstract, editorial, etc.

4. The Citation Index is arranged alphabetically by cited author. An entry for a cited item contains the first author's name and initials (when available), the year the cited item was published, and the name of the publication in which the cited item appeared along with its volume and page number. When there is more than one cited item for an author, these are arranged chronologically.

4. The first Science Citation Index (SCI), which was published in 1963, covered the literature of the calendar year 1961. It covered 613 journals, contained 1.4 million citations and required five volumes. From this first SCI those items dealing with genetics were selected and likewise published separately as the Genetics Citation Index. In 1986 ISI published a retrospective SCI covering the period 1955-1964; the edition covering 1945-1954 appeared in 1988.

4. According to Zunde (1971) there are three main application areas in citation analysis:

- 1) qualitative and quantitative evaluation of scientists, publications and scientific institutions;
- 2) modelling of the historical development of science and technology;
- 3) information search and retrieval.

A general reference for this part is Garfield's book (1979a). A recent review on citation practices can also be found in Todres (1986), showing the great interest for citation analysis that exists in the Soviet Union.

4. Citation analysis is that area of informetrics which deals with the study of these relationships. The main tool for this is a citation index: this is an ordered list of cited documents, each accompanied by a list of citing documents. Indeed, citation analysis might conceivably not have emerged as a serious academic issue had not the commercial development of citation indexing proved so successful.

4. The Science Citation Index and the Social Science Citation Index provide indexes to the contents of every issue published during a calendar year of approximately 5600 selected journals. As the composition and possible uses of both indexes are very similar, we will only describe the SCI. The journals which are covered are called 'source journals' and the items they contain are called 'source items'.

4. Scientific tradition requires, at least since the 19th century, that scientists writing articles refer to earlier articles which relate to the theme of the paper. These references are supposed to identify those earlier researchers whose concepts, methods, equipment, etc. inspired or were used by the author in developing his or her own article. (For a more detailed analysis of citers' motivations. see Chapter III.2).

4. The practice of giving references has been used to construct so-called citation indexes. More precisely, citation indexing is based on the idea that an author's references to previously recorded information identify much of the earlier work that is pertinent to the subject of this present document. A citation index is then a structured list of all the references in a given collection of documents.

4. To all intents and purposes the Science Citation Index (SCI), the Social Science Citation Index (SSCI) and the Arts & Humanities Citation Index (A&HCI) are the only citation indexes in practical use for scientific purposes. All three are distributed on a commercial basis by the Institute for Scientific Information (ISI), Philadelphia, USA, and are edited under the direction of the man whose idea it was to launch this large enterprise, namely Eugene Garfield.

4. A scientific paper does not stand alone: it is embedded in the literature of the subject. The nature of this embedding is specified by the use of footnotes and/or reference lists. The fact that a document is mentioned in a reference list indicates that in the author's mind there is a relationship between a part or the whole of the cited document and a part or the whole of the citing document.
